                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an SCR (Sequence Characterised amplified Regions) primer for distinguishing Korean beef meat from milk cow meat. The SCR primer distinguishes between the two quickly and accurately. The current sequence represents an SCR primer for distinguishing between beef
probe used to detect the nucleic acids of the invention and where an N residue is present at position 2 this is a biotinylated phosphoroamidite residue

The invention relates to a truncated neublastin polypeptide comprising an amino acid terminus that lacks one or more amino-terminal amino acids of a mature neublastin polypeptide. The polypeptides and mucleic acids are useful for treating neurodegenerative disorders such as ischemic neuronal damage, traumatic brain injury, peripheral neuropathy, neuropathic pain, Alzheimer's disease, Huntington's disease, Parkinson's disease, amyotrophic lateral sclerosis, memory impairment, diabetes, renal diseases, or glaucoma by moderating metabolism, growth, differentiation or survival of a nerve or neuronal cell. This polynucleotide sequence is a neublastin PCR primer of the invention

The invention relates to isolated polymucleotides (ABA90876-ABA90968 and ABA9080) and encoded proteins (ABB55698-ABB55800), especially conjunciocidectides SEQ ID NO 12 (ABA908767) and SEQ ID NO 19 (ABA90885) and SEQ ID NO 19 (ABA90885) and SEQ ID NO 20 (ABB55707) contained in clones bd306-7 and yb8-1 respectively and the clones bd306-7 and yb8-1 respectively and the clones bd306-7 and yb8-1 respectively and the clones bd306-7 and yb8-1 are deposited with the American Type Culture Collection (ArCO) with accession number 98599. The polymucleotides and encoded polypeptides have cycostatic, anti-inflammatory, immunomodulator, vulnerary, chrombolytic and anti-inflammatory activity and acting as cytokine modulators, cand anti-inflammatory activity and acting as cytokine modulators, cand anti-inflammatory activity and acting as cytokine modulators, chamatopoiesis regulators, tissue growth modulators and/or cadherin charapies, particularly for preventing, treating or amelicrating any of the following diseases: immune deficiency and disorders; e.g. bacterial or fungal infections, autoimmune disorders, categorousis or cytomatosus or graft-versus-host disoases; myeloid or lymphoid cell deficiencies; wound, burns, incisions and ulcers, osteoporosis or cytomathies, e.g. Alzheimer's, Parkinson's disease, Huntington's characterial selection or stroke, inflammations, shock, sepais
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New secreted proteins and encoding polynucleotides, useful in gene therapies, particularly for preventing or treating autoimmune disorders, cancer, graft-versus-host disease, wound, osteoporosis, stroke or

```
The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotide primers amplifying gene regions conserved among mammals - useful for developing genomic maps, isolating clones and making cross-species comparisons.
endotoxin lethality, arthritis, inflammatory bowel disease or Crohn's disease; or tumours or cancers, pemphigus vulgaris or pemphigus foliaceus. The present sequence is that of a blotinylated oligonuclectide with a phosphoaramidite residue, useful to the invention

```
The present invention specifically claims an element shown by: (A) a 19 bp base sequence, CCAATNNNNN NNNNCCACG (ERSB); or (B) a modified base sequence having replaced 1.3 bases with the other base(s), which induces transcription with stress on endoplasmic reticulum used for stress competence of endoplasmic reticulum. Also described are: (1) a DNA having transcription inducing activity with stress on endoplasmic reticulum containing the above mentioned element, optionally further containing a promoter DNA, and (2) a vector containing the element can be used for the inhibition of growth and induction DNA. The element can be used for the inhibition of growth and induction dispasses and cystic fibrosis by inhibition of symptoms of canter colls, and improvement of symptoms of canter calls, and improvement of symptoms of canter calls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Endoplasmic reticulum; stress; ER; transcription factor; transcription; regulatory element; ERSE; bZIP; chaperone; treatment; prophylaxis; cancer; arteriosclerosis; ischaemia; wound healing; cystic fibrosis;

An endoplasmic reticulum stress transcription factor (bZIP) capable of regulating transcription inducing activity exhibited by an element (ERSE) can be used in a method for controlling expression of an endoplasmic reticulum chaperone. The method comprises expressing bZIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum chaperone gene. bZIP is useful for controlling the expression of endoplasmic reticulum chaperone either positively or negatively in cells and therefore is useful for treatment or prophylaxis of encers and endoplasmic reticulum chaperone either or prophylaxis of encers. bZIP also maintains the correct conformation diseases, wounds and ulcers. bZIP also maintains the correct conformation of the endoplasmic reticulum chaperone and thereby increases the expression of a foreign protein. This sequence taken from the glucose regulating protein (GRP) promoter GRP94 contains an BRSE like sequence. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                New endoplasmic reticulum stress transcription factor (known as bZIP) for controlling expression of endoplasmic reticulum chaperone, useful for treating cancers, arteriosclerosis, cystic fibrosis, ischemic diseases,
chicken; gene expression; GRP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 19 BP; 4 A; 9 C; 5 G; 1 T; 0 U; 0 Other;

```
AASO6832-AASO6897 represent part of a polymucleotide sequence encoding for novel human protein kinases where a single nucleotide polymorphism (SNP) has been identified. The SNP occurs at the last position of the present sequence. The sequences are described relating to the invention of novel human protein kinases #1-57 (AMU03501-AAU03557). The novel protein kinases (ATK and 1-57 (AMU03501-AAU03557). The novel control of the protein kinases (ATK and STK) families. The polymorlootides serine/threonine kinase (ATK and STK) families. The polymorlootides prevention, diagnosis and treatment of diseases associated with imappropriate kinase expression. For example, they may be used to treat cancers (especially cancers of haematopoietic origin), cardiovascular disease (e.g. atherosclarosis), membolic disorders (e.g. diabetes), immune related diseases (e.g. rheumatoid arthritis), neurological immune related diseases (e.g. rheumatoid arthritis), neurological protein kinase (e.g. disease), inflammatory disorders (e.g. asthma), infectious disease (e.g. HIV) and reproductive disorders (e.g. asthma), infectious disease (e.g. HIV) and reproductive disorders (e.g. infertility).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gene therapy and as DNA probes in diagnostic assays. The protein Kinase polypeptides may be used as antigens in the production of antibodies against the protein kinases and in assays to identify modulators of

The invention relates to a method for determining whether an individual is likely to be susceptible to malignant melanoma, and determining the genetic basis for the melanoma in an individual. The method involves screening the genome of the individual for the presence or absence of one or more polymorphic variants of the XRCC3 gene. Sequences AA447412-420 represent PCR primers used in a genotyping assay of a candidate DNA repair gene XPD
                                                                                                                                       The present invention relates to the H gene derived from canine distemper virus (see AAF6557). The H gene sequence can be used in the prevention, treatment and detection of mammalian distemper, particularly canine distemper virus (CDV). The present sequence is a PCR primer, which was used in the present invention
                                                         H gene, used for treating, preventing and detecting mammalian distemper, particularly canine distemper viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining the susceptibility of an individual to malignant melanoma, involves screening the genome of the individual for the presence or absence of one or more polymorphic variants of the XRCC3 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         XRCC3; XPF; melanoma; genotyping; DNA repair gene; XPD; PCR primer;

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker completed protected from the resultant corresponding to the marker is detected from the resultant corresponding to the marker is detected from the resultant corresponding to the marker is detected from the resultant corresponding to the marker is detected from the marking is changed so that the same discrimination Nos. of the multiwell cof the maximum in the specified discrimination Nos. to array the multiwell cof the maximum in the specified discrimination Nos. to array the multiwell corresponding to that the same discrimination Nos. succeed to discrimination Nos. are mixed respectively in each wells of longitudinal corresponding to the mixed clones are cultured and the call lateral directions; (f) the mixed clones are cultured and the created from the amplified products; (h) the clones in the multiwell corresponding from the detected result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The crons in the multiwell corresponds for human chromosome 126-35 DNA, and ABM45323 to ABM45634 crepresent PCR primers for human chromosome 21q22.1, which are corrected in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

Katz E, Pabalan J, Aguilar D; S;

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or second active associated with lung and/or nasal airway dysfunctions and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory steroid and ubiquinone. A composition may have a immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an autioniflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of, or receptor, producing bronchodilation, increasing levels of ubiquinone or lung suffactant in a subject, for reating bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed of the thin wind interval to the printed of the thin increasing format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

31-OCT-2002.

Miller S,

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 12575; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitlenamatory steroid and ubiquinone. A composition of the invention has antiinflammatory steroid and ubiquinone. A composition of the invention composition antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine or receptor, producing bronchodilation, increaging levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchodilation, contracting bronchodilation, increaging levels of ubiquinone or lung inflammatory than all all producing all and all producing bronchodilation, increaging levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO cut if the printed and for this patences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated double stranded RNA oligomucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligomucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polymucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligomucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the anti-HCV agent LZ129 mutant RNA of the invention which contains a C3G mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the anni-HCV agent LZ129 mutant RNA of the invention which contains a G4C mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

To develop antisense oligos, the test system employed mouse NIH 3T3 cells stably transfected with an internally deleted construct of the human gene for the pro alpha 1(1) chains of type I procollagen COLLAI). A series of modified oligos were synthesised using a region at the 3' end of excn 1 and the first two nucleotides of intron 1 of the exogenous (human) gene as a target. This sequence is given in AAQ66555 which corresp. to bps 198 -225 if the adenine at the start of transcription is counted as poon. The corresp, which corresp to bps 169-195. The antisense oligos are given in AAQ66557, which corresp to bps 169-195. The antisense oligos are given in AAQ66557. Geoficia. The antisense oligos in metant or normal collagen genes. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                 Anti:sense oligo:nucleotide(s) against mutant or native collagen genes for inhibiting collagen expression, e.g for treating osteoarthritis, liver cirrhosis, excessive scarring etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is designed to bind to a truncated deriv. of ATI (McClain, C al., Science 238, 527-530 (1987), so targetting cleavage of this c aubstrate by Rhase P. ATI comparises the acceptor stem, the T-stem and cloop, and the 31 terminal NCCA nucleotides (nt) of the tRNA PHE gene. The cloop, and the 31 terminal NCCA nucleotides (nt) of the tRNA PHE gene. The cerulting linear DNA was trains. cribed in vitro with SP6 polymerase, transcription yielding a short 5' leader sequence, and an extra 3'C restriction site. A 51 nt deriv., pATI (see AAQ2289) lacking residues 25 of ATI was also prepd,, and used to create a truncated substrate concered by E. coli RNAse P or M. RNA under conditions where pATI was not cleaved by E. coli RNAse P or M. RNA under conditions where pATI was cleaved efficiently. However if the cleaved EGS sequence (shown here) was cleaved efficiently. However if the cleaved EGS sequence (shown here) was cleaved efficiently. However if the cleaved EGS sequence (shown here) added to the mixt., cleavage occured as normal. This led to the design of cased that he cleaved EGS sequence (shown here) cracet sequence) and a 3' NCCA terminal, (N = a purine). Compsns. context the presence of viral RNAs themselves. RNAse P based therapy may be used to deliver engineered sequences into the haematopoietic cells of patients with e.g. HIV, HILV-I and various retroviral induced leukaemias. ö To develop antisense oligos, the test system employed mouse NIH 373 cells stably transfected with an internally deleted construct of the human gene for the pro alpha 1(1) chains of type I procollagen CCLIAI). A series of modified cligos were synthesised using a region at the 3' end of exon I and the first two nucleotides of intron 1 of the exogenous (human) gene as a target. This sequence is given in AAG66555 which corresp. to bys 198 198 225 if the adenthe at the start of transcription is counted as poen. The corresp, sequence of the endogenous (mouse) gene is given in AAG66559. Which corresp to bys 169-195. The antisense oligos are given in AAG66559. Goodely. The antisense oligos inhibit the expression of mutant or normal collagen genes. (Updated on 25-MAR-2003 to correct PN field.) A novel DNA construct (preferably a retroviral vector) has been produced for the treatment of human mammary cell disorders or diseases, including human mammary carcinoma. The DNA construct comprises at least one therapeutic gene under the transcriptional control of the whey acidic Gene expression; human mammary carcinoma cell; whey acidic protein; mouse mammary tumour virus; WAP; MWTV; polymerase chain reaction; ss. expression in human mammary carcinoma cells - using whey acidic 0; Gaps 3.1%; Score 13.2; DB 1; Length 20; 83.3%; Pred. A retroviral vector carrying a DNA sequence encoding SDI-1 (senescent cell derived inhibitor 1), a functional analogue, fragment or antiSense SDI-1 DNA sequence has been developed. The present sequence represents C FOR primer B used in the amplification of mouse leukaemia virus (MLV) retroviral vector beta galactosidase gene (BAG) LTR, for use in the cetroviral vector can be used in the treatment of a polylinker. The retroviral vector can be used in the treatment of disorders or diseases responsive to the anti-proliferative activity of SDI-1, e.g. for the treatment of cencer or restences, septencelly, septencially for the treatment of breast cancer. The retroviral vector acts to introduce the relevant DNA sequences, sense or antisense, into human cells in vitro or in vivo. The retroviral vector antistered by injection or by implantation of a packing cell ine in to the body nearby or at the site of the tumour. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                              ö
protein (WAP) or mouse mammary tumour virus (MMTV) regulatory sequences. The present sequence represents PCR primer B which is involved in the deletion of the U3 region from the murine leukaemia virus (MLV) retroviral vector, known as BAG, and the insertion of a polylinker, which is used in an example for the production of a DNA construct as described above. The WAP and MMTV regularory sequences are able to direct the efficient expression of a linked heterologous gene in primary human mammary cells, including mammary carcinoma cells. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Retroviral vector carrying senescent cell derived inhibitor 1 DNA - used in the treatment of diseases responsive to anti:proliferative activity,

the Arrys758-T92817 represent amplification primers for human genes which are used in the chimeric non-human animal of the invention. The chimeric non-human animal of the invention, preferably a mouse, contains a foreign chromosome (s) or chromosome fragment. The animal is produced by obtaining a hybrid cell by fusion of a cell containing the foreign chromosome with a cell having the ability to form microcells. The microcells are prepared, and fused with cells having differentiative pluripotency and containing the foreign chromosome. These cells are then introduced into an embryo, which is then chromosome. These cells are then introduced into an embryo, which is then chromosome segment to term. The foreign chromosome segment is at least in the long and preferably contains a region for an antibody. The chromosome segment could also contain genes associated with human chromase in the interluckin-2 gene, and the Huntington's disease gene. The expression of foreign genes (especially human genes) in a nonhuman animal is useful for efficient production of proteins, especially of human animal is useful for efficient production of proteins, especially of human animal is useful material can be isolated and fused with myeloma cells to produce the antibody); gene (e.g. to produce the antibody)
                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primer; amplify; human gene; chimeric non-human animal; antibody; transgenic mouse; chromosome fragment; hybridoma production; microcell; Huntington's disease gene; pluripotent cell; interleukin-2 gene; myeloma cell; immunoglobulin gamma-1; constant region; 1991; ss.

The present invention describes a method of obtaining pluripotent cells containing foreign chromosomes or their fragments (preferably at least containing foreign chromosomes or their preparing cancerous calls containing the foreign chromosomes or fragments, then fusing these with pluripotent cells such as embryonic stem cells, embryonic reproductive cells embryonic cancer cells or their mutants. Also cascribed are; (1) a method of obtaining hybridoma cells py fusing a cell chart a high ability to produce hybridoma cells (such as mouse A9 cells) with a cell containing the foreign chromosomes or fragments (such as normal human diploid cells); (2) a method of utilising pluripotent cells or produce chimeric and transgenic non-human animals (especially mammals nutroduced; and (3) chimeric animals, their offspring and tissues and cells derived from the offspring produced by a method as in (2). The introduced; and (3) chimeric animals, their offspring and tissues and cells acan be used for the production of monoclonal antibodies for medical use which are of human type and therefore not antigent in humans. They can also be used in the production of chimeric and serve as models for the study of human diseases. Adv52755 to A4v52828 are perve as models for the study of human diseases. Adv52755 to A4v52828 are

This sequence represents Basta-resistance gene (bar) PCR primer Bar 2, used with primer Bar 1 (AAZ32671) to determine whether the bar gene had been stably introduced into the genome of Basta-resistant plantlets. The pantlets had been previously been transformed with a superoxide dismutase (SOD) expression vector comprising a cucumber fruit dominant promoter (ASO), a cassava mSOD1 gene and the bar gene. SODs are ubiquitous enzymes which convert superoxide anion radicals to hydrogen peroxide is then converted to water by peroxidases or catalases. Superoxide anion radical, are generated by companisms in response to environmental and biological stresses. SOD is thought to be effective in the treatment of arthritis, rheumatism, is chaemic heart disease and radiation damage, and has been used in cosmetics for the prevention of skin ageing The transgenic plants cosmetics for cosmetical for cosmetics, including massage packs, or as an enditive in functional foods or medicines. The plants can be used as

```
The present sequence represents a PCR primer for the human p51 gene, which is related to p53 and has cell proliferation regulation and tumour suppression activity. The p51 gene can be used in the investigation, diagnosis and treatment of diseases such as cancer, with which the p53 family cell proliferation regulation is associated. The p51 protein may be used for screening potential agonists and antagonists of its regulatory function, for use as drugs,

PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY36754-4737949) which can be used as vaccines against Chlamydia trachomatis. Antiense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, opidymitis, cervicitis, salpingitis, perimpatitis, barbolintis; pneumopathy in breast feeding infants; and veneral lymphogramulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFS encode polypeptides (see AAY36794-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                  This oligonuclectide is used as a reverse primer, together with a forward primer (see AAV64429), in quantitative FCR of the mouse ss3 gene. 10 demonstrate spairs (see AAV64427-46) were used in quantitative FCR to demonstrate elf (see AAV6411-13), sa3, and 145 (see AAV64414) expression in bloc and liver explant cultures, compared to HNF3-beta, C/EBP, alphafetoprotein and glyceraldehyde 3-phosphate dehydrogenase. The invention provides early developing liver proteins and the genes coding for them (see AAV6410-24). These can be used in the treatment and diagnosis of liver diseases and other disorders, including those relating to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vaccine, eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.
                                                                                                                                                                                                                                                                    New isolated early liver development genes - used to develop products for treating, e.g. liver disease, hepatocellular carcinoma, degenerative neurological disorders, anaemia, ataxia or haemochromatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps

                                                                                                                                                                                         ö
conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococoal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a primer/probe sequence of the invention. The primer and probe sequences are derived from the sequence of the human serine protease gene LKB1, and are used to detect variations in LKB1 leading to Peutz-Jeghers (PD) syndrome. The primers and probes can be used for the diagnosis, investigation and treatment of diseases in which variations in the LKB1 gene are implicated, such as PJ syndrome

A method has been developed of treating defective tissue comprising: (i) providing a number of hNT neurons and a neurologically defective mammal having a target tissue comprising defective cells, and (ii) transplanting the hNT neurons into the defective man, so that the neurological defective for the mammal is ameliorated. Also described is a non-human mammal having transplanted hNT neurons. The method is especially used to treat Huntington's disease or other neurological disorders. The method allows the transplanted to of the neurological disorders. The method allows the transplanted to treat and differentiated neurons from cell lines. The present sequence represents a PCR primer used in an example from the present invention for in vitro characterisation of hNT neurons
                                                                                                                                                                                                                                                                                              ,

Antisense oligonucleotides targeted to nucleic acids encoding human tumor necrosis factor receptor-associated factor (TRAF), useful for treating
                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of nested primer NP2, which was used in the amplification of gene fragments obtained from a suppression subtractive hybridization reaction using LAPC xenograft cDNA and designed to identify novel prostate and prostate cancer-specific genes. A 437 bp clone was obtained. Pull-length cDNA (see AAZ94275) was subsequently cloned from a transcription factor that is normally expressed only in testis tissue, but is up-regulated in prostate and other types of cancer. The invention provides diagnostic and therapeutic methods useful in the management of various cancers which express PHELIX, including prostate cancer, bladder cancer, ovarian cancer and testicular cancer
                                                                                                                                                                                                                                                            Testis specific Helix Loop Helix proteins expressed in cancers and useful for the prevention, diagnosis and treatment of prostate, bladder and ovarian tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tumour necrosis factor receptor-associated factor; TRAP; human; antisense oligonucleotide; phosphorothioate; antiproliferative; anti-inflammatory; B-selectin; jun kinase; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a PCR primer used to amplify a fragment of the human mitochondrial DNA. The PCR product is used to create a probe which is used in the Southern blot analysis of cells transfected with the recombinant plasmid of the invention. The plasmid is useful for the production of large insert episomes in mammalian cell. The plasmid comprises a lymphotrophic herpes virus segment and a heterologous insert explication and a hererologous origin of plasmid comprises an episome in both bacterial replication which is maintained as an episome in both bacterial and mammalian cells. The recombinant plasmid is useful for transforming mammalian cells.

Specially B-lymphoblastoid cells (BLC), epithelial cells (BC) or a fusoficient. The recombinant plasmid is also useful for the production of these, by transfecting a mammalian cell with the plasmid by lipofection. The recombinant plasmid is also useful for the production of large-insert episomes in mammalian cells. The invention also relates to an epistein barr virus nuclear antigen-1 (BBNA-1) gene having a partial RS domain deletion which is from 300-700 nucleotides in length. The BBNA-1 gene is useful as a therapeutic agent, especially in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PHELIX; human; testis-specific; transcription factor; prostate cancer; bladder cancer; ovary cancer; testicular cancer; gene therapy; diagnosis; vaccine; PCR primer; ss.

diseases associated with TRAF expression such as inflammatory diseases.

```
The present invention relates to antisense oligonucleotides (see AAA55496 -A55757) which are targeted to nucleic acids encoding a human tumour necrobis factor receptor-associated factor (TARF). The antisense enecrobis factor septoral acids encoding a human tumour necrobis factor receptor-associated factor (TARF). The antisense comprise at least one modified internucleotide linkage, which is a phosphorothioate linkage. The oligonucleotides also include at least one modified sugar moiety such as a 2-O-methoxyethy sugar moiety. Sequences AAA55490-A55495 represent nucleotide sequences encoding human TRAF1-6. Included in the invention is a method for treating a human having a disease associated with the expression of TARF comprising administering an antisense oligonucleotide. The reduction of jun kinase administering an antisense oligonucleotide for the reduction of E-coligonucleotide targeted to TRAF-6. A method for the reduction of E-cissues with an antisense oligonucleotide targeted to TRAF-6. The antisense oligonucleotides have antiproliferative and anti-cissues with an antisense oligonucleotide targeted to TRAF-6. The antisense oligonucleotides have antiproliferative and anti-cit in antisense oligonucleotide for the antisense oligonucleotide with an antisense oligonucleotide may also be used as a diagnostic probe for studying gene function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PTAN; testis specific; prostate cancer; overexpress; chromosome 1q22; diagnose; cancer; breast; vaccine; PCR primer; ss.

BPC-1 polypeptides and polymucleotides can be used for the detection of PBC-1 polypeptides and polymucleotides in biological samples, this is particularly useful for detecting cancers expressing BPC-1, e.g. prostate cancer or bladder cancer. Antibodies directed against BPC-1 or antisense This sequence represents a PCR primer used in the isolation of cDNA fragments of the PTAN (testis specific protein expressed in prostate cancer) gene. PTAN is expressed in 3 isoforms PTAN-1, 2, and 3. The PTAN gene is located on chromosome 1022. PTAN is overexpressed in prostate cancer, and has a testis specific expression pattern in adult tissues. PTAN shows no homology to any known gene. PTAN can be used in methods for the diagnosis of cancer, especially prostate or breast cancer, where the normal tissue samples are prostate itssue, or breast tissue, bone tissue, lymphatic tissue, serum, blood, or urine. A vector containing the PTAN rincleotide sequence, a vaccine composition targeting PTAN, PTAN, ribozymes specific for PTAN mRNA and antisense sequences, rospecially breast and prostate cancers. Cancer development can be inhibited by a vaccine composition targeting PTAN New isolated BPC-1 polypeptides, useful for developing products for the diagnosis, staging, prognosis and treatment of cancers, particularly prostate or bladder cancer. polymuclectides can be used for treating such cancers. The BPC-1 colympetides can also be used in vaccines for treating or inhibiting the development of a cancer expressing BPC-1. The polypeptides and colympetides can also be used for detection, prognosis, drug screening and predicting susceptibility to developing cancer. The BPC-1 polypeptide comprises a CUB domain which is expressed in prostate and bladder cancer carcinoma cells and which shows sequence similarity with CUB domains from other known proteins. In normal human tissues BPC-1 is only expressed in carcinoma cells and which however, it is expressed at high levels in prostate cancer cells and bladder cancer cells. A number of synthetic oligonucleotides were used to generate BPC-1 cDNA from total cell RNA of tumour cells lines. These primers were a cDNA synthesis primer (AAZ93041), two adaptors equences (AAZ93044), AAZ93045), a PCR primer (AAZ93046) and two nested primers (NP)1 used in the amplification method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a method for obtaining a transgenic plant with male sterility. The method uses site specific recombination to stably transform the plant cells. The method involves the use of DNA encoding the histocyte lethal protein, linked to an anther specific promoter. The method is used to produce male sterile plants. Sequences AAAS9949 to AAAS9961 are used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide SEQ ID 13 used in method to culture sterile male plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Male sterile plant; transgenic plant; histocyte lethal protein; anther specific promoter; ss.

A partial clone, termed 22P4FI1 (see AAZ94894), was obtained and used to identify gene in normal tissues, and is also expressed in human prostate tumours, in some cases at high levels. The 22P4FI1 transcript and/or protein (see AAY9489) may represent a useful diagnostic marker and/or protein (see target for prostate cancer. Wethods of using 22P4FI1 polymucleotides, polypeptides and antibodies for the diagnosis and treatment of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel testes-specific gene 22P4F11 which is expressed in human prostate cancer and is useful as a diagnostic marker and/or therapeutic target for prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cancer, are provided, as well as

PCR primers AAA14805-07 were used to amplify testis-specific protein Yencoded DNA. The specification describes a new method of diagnosis of prostate cancer. The method comprises determining the level of testis-specific protein Yencoded (TSPY) mRNA or protein, and comparing these presence of elevated TSPY mRNA or protein is indicative of prostate presence of elevated TSPY mRNA or protein is indicative of prostate cancer. Detection of TSPY mRNA expression or protein levels useful in the diagnosis of prostate cancer. Antisense polymucleotides complementary to the coding sequence of human TSPY are useful for treating prostate cancer by inhibiting TSPY transcription (when contacted with the TSPY mRNA). Ribozymes are also useful for treating prostate cancer by cleaving the TSPY mRNA and therefore inhibiting its translation. The vaccine is useful for translation inhibiting the development of prostate cancer in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Foreign chromosome; microcell fusion; homologous recombination; antibody; targeting vector; transgenic animal; disease model; knockout animal; PCR primer; human; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing prostate cancer by determining the level of testis-specific protein Y-encoded (TSPY) mRNA or protein and comparing these TSPY mRNA or protein levels to those of a normal tissue sample.

The invention relates to a novel method of producing cells containing a modified foreign chromosome or chromosome fragment. The method comprises:

(a) fusing a microcell comprising the foreign chromosome or chromosome fragment, with a cell having a high efficiency for homologous recombination; (b) marking the desired site of insertion of the foreign chromosome using a targeting vector; and (c) inducing deletion or translocation at the marked site. Transpenic animals produced by the method are useful to provide disease models and knockout animals, and in the production of human proteins, particularly human antibodies. This sequence is used in the method of the invention
                                                                                                                                                                                                                                 Producing a cell containing modified foreign chromosomes, useful for the generation of transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Recombinant Corynebacterium DNA useful for production of pantothenic acid vitamin, comprises panB, panC or ilvD genes encoding enzymes.

Example 1; Page 6; 27pp; German.

This invention describes novel recombinant Corynebacterium DNA (I), present in microorganisms of the Corynebacterium genus and comprising at least one of the pans (ketopantohydroxymethyltransferase), panc (pantothenicacidsynthetase), especially the pansC operon, and/or ilvD (dhydroxyaciddshydratase) genes. (I) is useful for the preparation of pantothenic acid a vitamin which has applications including cosmetics, medicine and human and animal nutrition. The new preparation method using fermentation techniques produces the required stereo-isoform D form of pantothenic acid. This sequence represents a primer used in the isolation of the Corynebacterium glutamicum pansC operon which is described in the method of the invention

Novel putative transcription factor gene 36P1A6 for treatment, diagnosis and prevention of prostate, bladder, cervical, ovarian, pancreatic, and colonic cancer.

Example 1; Page 30; 53pp; English.

The human 36P1A6 gene encodes a putative transcription factor based on homology to the murine EHF gene which encodes a transcription factor which is a member of the ETS family. 36P1A6 is expressed in androgendependent and androgen-independent LAPC prostate cancer xenografts and in normal prostate at approximately equal levels. The highest expression is

in the prostate and colon. 36PlA6 may be involved in activating tumorpromoting genes or repressing genes that block tumorigenesis. The 36PlA6 polynucleotides and polympetides are used for the treatment and diagnosis of cancer, e.g. prostate, bladder, cervical, ovarian, pancreatic and colonic cancer (all claimed). Anti-36PlA6 antibodies may be used for purifying 36PlA6 and for isolating 36PlA6 homologues. Antisense purigonal cancer is an electron of the second and transcription and translation of the 36PlA6 gene (claimed). The 36PlA6 polynucleotides and immunogenic fragments may also be used in cancer and polypeptides and immunogenic fragments may also be used in cancer vaccines (claimed)

30P3CB polypeptide and polynucleotide used for diagnosing, treating and monitoring development of prostate cancer.

Example 1; Page 57; 99pp; English.

The present invention describes human prostate specific protein 30P3C8, which is over-expressed in prostate cancer cells. 30P3C8 has cytostatic content and gene therapy. Methods for activity and can be used in vaccines and gene therapy. Methods for detecting the levels of 30P3C8 protein or mRNA in prostate tissue, bone cativity and can be used in vaccines in an individual or dissegulated cell growth e.g. the presence of cancer in an individual or dissegulated cell growth e.g. hyperplasia. The cancers which are detected or diagnosed are of the bladder, pancreas, colon, brain, bone, lung, kidney or prostate by using cet est samples of serum, blood or urine or tissues of the bladder, pancreas, colon, brain, bone, lung, kidney and prostate approstate cancers lung, winger or prostate by using colon, brain, bone, lung, kidney and prostate. 30P3C8 or polynucleotide sequences can be used for treating cancers expressing colon, brain, bone, lung, mannogenic portions of 30P3C8 are in spaced and other proteins cancers. Immunogenic portions of 30P3C8 are concolonal antibodies bind to 30P3C8 and disrupt interactions between the properties of a receptors for which 30P3C8 is a ligand.

30P3C8 may be a growth factor or other molecule involved in tumour growth and metastasis and other or other molecule involved in tumour growth and metastasis and so anti-30P3C8 antibodies may disrupt the homing or

invasion or other cancer promoting activities of 30P3C8. The assays are used for detecting, staging and monitoring prostate cancer. The 30P3C8 protein or mRNA are used as additional specific markers for detecting prostate cancer and provide a more specific assay than the serum prostate specific antigen (PSA) assay. The present sequence represents a 30P3C8 nested primer, which is used in the exemplification of the present

New antieense compound for inhibiting the expression of signal transducer and activator of transcription 3 (STAT3) in cells or tissues and treating diseases or condition associated with STAT3, such as rheumatoid arthritis and cancer

Example 12; Page 63; 104pp; English.

The present invention describes an antisense compound (1), 8 to 30 ento-leokages in length, that is targeted to a nucleic acid molecule encoding STAT3 (Signal Transducer and Activator of Transcription) and which inhibits the expression of it. (1) has antiinflammatory, antirheumatic, cytostatic and immunostimulatory activities. (1) is used for inhibiting the expression of STAT3 in cells or tissues, treating an animal having a disease or condition associated with STAT3 or a human having a disease or condition characterised by a reduction in apoptosis, and inducing apoptosis in a cell. Diseases or conditions that are treated are rheumatoid arthritis, cancer of the breast, prostate, brain, had and/or neck, leukaemia, myeloma, melanoma or lymphoma. (I) can also be used for diagnostic methods in detecting and determining the role of STAT3 in various cell functions, physiological processes and conditions and for diagnosting the conditions

```
ö
(I) can be used alone or with other drugs as an immunostimulator. (I) is used in sandwich and colourimetric assays, involving enzyme conjugation and radiolabeling and is used in diagnostic kits. AAC93150 encodes human STAT3 and AAC932131 encodes mouse STAT3 as given in the exemplification of the present invention. AAC93151 to AAC93230 and AAC93232 to AAC93239 represent STAT3 phosphorothioate antisense oligonucleotides, and AAC93300 represents a mismatch control oligonucleotide which are used in example
                                                                                                                                                                                                                                                                              Human STAT3 phosphorothioate antisense oligonucleotide SEQ ID NO:134.

New antisense compound for inhibiting the expression of signal transducer and activator of transcription 3 (STAT3) in cells or tissues and treating diseases or condition associated with STAT3, such as rheumatoid arthritis and cancer.

Example 12; Page 63; 104pp; English.

The present invention describes an antisense compound (I), 8 to 30 mucleobases in length, that is targeted to a nucleic acid molecule encoding STAT3 (Signal Transducer and Activator of Transcription) and which inhibits the expression of it. (I) has antiinflammatory, antirheumatic, cytostatic and immunostimulatory activities. (I) is used for inhibiting the expression of STAT3 in cells or tissues, treating an animal having a disease or condition associated with STAT3 or a human having a disease or condition characterised by a reduction in apoptosis, and inducing apoptosis in a cell. Diseases or conditions that are treated are rheumatoid arthritis, cancer of the breast, prostate, brain, head and/or neck, leukaemia, myeloma, melanoma or lymphoma. (I) can also be used for diagnostic methods in detecting and determining the role of STAT3 in various cell functions, physiological processes and conditions

```
and for diagnosing the conditions associated with expression of STAT3.

(I) can be used alone or with other drugs as an immunostimulator. (I) is used in sandwich and colourimetric assays, involving enzyme conjugation and radiolabeling and is used in diagnostic kits. AAC93150 encodes human STAT3 and AAC93231 encodes mouse STAT3 as given in the exemplification of represent invention. AAC931310 and AAC93132 to AAC93299 represent statis phosphorothicate antisense oligonucleotides, and AAC93100 represents a mismatch control oligonucleotide which are used in example
                                                                                                                                                                                                                                                              from the present invention

Novel 24P4C12 polypeptides and polynucleotides, used in the diagnosis and treatment of cancer, especially prostate cancer.

Example 1; Page 65; 137pp; English.

The present invention describes a prostate tumour associated gene, designated 24P4C12, and its encoded protein. 24P4C12 has anticancer and cytostatic activity, and can be used in vaccine production and in gene therapy. A pharmaceutical composition or vaccine comprising 24P4C12 can be used to treat a patient with cancer, especially prostate cancer, the vaccine can also be used to inhibit the development or progression of cancer. The polypeptides and polymucleotides can be used to diagnose cancers, especially prostate cancer. A transgenic animal comprising 24P4C12 can be used for the development and screening of therapeutic reagents. The polypeptide is a transmembrane protein which is expressed specifically in prostate cancer, allowing the development of more specific anticancer therapies and diagnostic assays

The gene, which is found at chromosome 15q32-23, is upregulated in cancers such as that of the prostate, bladder, colon and pancreas. The sequences can be used to diagnose and treat these cancers, and to vaccinate against them. The present sequence is a PCR primer for the coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to methods and compositions for the diagnosis and therapy of prostate cancer which utilise human SGP28 (Specific granule protein 28) gene and proteins. The method involves detecting cancers, particularly of prostate and colon, from expression of SGP28 protein. The expression of SGP28, which is an extractly up-regulated in prostate tumours. SGP28 sequence is used for diagnosis (including in vivo imaging), staging, monitoring and prognosis of prostatic and colon cancer, and for assisting selection of therapy.

Composition or vaccine that contains a vector expressing an antibody specific for SGP28 expressing cancers can be treated by administering a composition or vaccine that contains a vector expressing an antibody specific for SGP28 protein or therapeutic agent. SGP28 grotein or its gracial conjugated to toxin or therapeutic agent. SGP28 grotein or its specific for SGP28 protein or therapeutic agent. SGP28 grotein or its also used as source of therapeutic antisense or ribozyme agents. SGP28 protein and its creaments and for isolating related sequences. SGP28 protein and its conjudence and solation and its calcium entry into prostatic cells, for recombinant production of SGP28 peptides and for isolating related sequences. SGP28 protein and its creaments are used to raise specific antibodies (Ab) and to identify specific binding agents (potentially useful as therapeutic and diagnostic agents) and also potential anticancer agents. The present sequence is a nested primer 2 (NP2) used to amplify gene fragments resulting from SSH (suppression subtractive hybridisation) reaction. This sequence is used in the SSH isolation of cDNA fragment of human SGP28 gene

Producing a database for identifying polymorphic genetic markers, comprises obtaining data relating to members of a healthy population and entering the information into a database.
                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides a database of human samples obtained from healthy individuals which can be used to identify polymorphic genetic markers. Data obtained for the database can be used to sort the samples by parameters such as age, sex and ethnicity. This is useful in linking markers with diseases, susceptibility to infection and drug responses. The present primer was used in an assay to demonstrate the uses of the database of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human T-type low voltage activated calcium channel alphalG-c; stress; epilepsy; schizophrenia; depression; sleep disorder; Cushing's disease; endocrine disorder; respiratory disorder; peripheral muscle disorder; muscle excitability; fertilisation; contraception; hypertension; neuronal firing regulation; cardiovascular disorder; gene therapy; forensic analysis; epidemiological study; neuroleptic; PCR primer; ss.

The invention relates to isoform of human T-type low voltage activated calcium channel (alpha1G-c) cDNA and protein. Cells transformed with calcium channel DNA to express calcium alpha1G-c channel protein are used calcium channel DNA to express calcium alpha1G-c channel protein are used to identify specific modulators (antagonists or agonists). These condulators are useful as therapeutic agents and are used for treating wide range of calcium alpha1G-c channel-mediated disorders, e.g. stress conductive disorders, respiratory disorder, peripheral muscle disorder, endocrine disorders, respiratory disorder, peripheral muscle disorder, contraception, disorders involving the muscle excitability, fertilisation, contraception, disorders involving cipalals and cardiovascular disorders (e.g. atherosclerosis, cardiac hypertrophy, angina pectoris). Calcium alpha1G-c channel DNA is useful contionally used as antisense sequences, in gene therapy. Calcium channel contionally used as antisense sequences, in gene therapy. Calcium channel contionally used as antisense sequences, in gene therapy. Calcium channel contionally and identifying related muschindard hybridistation or immunological assays. The present sequence is 18341P PCR primer used for immunological assays. The present sequence is 18341P PCR primer used for thalamus library for generating human calcium alpha1G-c channel sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; 36P6D5 protein; secreted tumour antigen; therapy; cancer; kidney; bladder; ovary; breast; pancreas; colon; lung; vaccine; cytostatic; SSH; suppression subtractive hybridisation; PCR primer; ss.
                                                                                                                                                New nucleic acid encoding human calcium channel protein, useful for identifying specific modulators and potential pharmaceuticals for

The present invention relates to a gene and its encoded secreted tumour antigen, termed 36P6D5. These sequences are used for the diagnosis and treatment of various cancers which express 36P6D5, such as cancers of the kidney, bladder, ovary, breast, pancreas, colon and lungs. In normal individuals 36P6D5 protein, is predominantly expressed in pancreas, with comprising immunogenic protein of 36P6D5 is useful for inhibiting the comprising 36P6D5 protein is useful for diagnosis and/or prognosis of prostate cancer and other cancers, for modulating or inhibiting the comprising 36P6D5 genes and/or translation of the 36P6D5 transcripts, and as therapeutic agents. The present sequence is a nested primer (NP)2 used to amplify gene fragments resulting from SSH (suppression to counter bybridisation) traction. This sequence is used in the SSH isolation of cDNA fragment of human 36P6D5 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; PC-LECTIN; C-type lectin; transmembrane antigen; normal testis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New PC-LECTIN polynuclectide encoding a transmembrane antigen over expressed in human prostate cancer, useful for the prognosis, diagnosis and treatment of prostate cancer.
                                           Detecting presence of cancer expressing 36P6D5 protein in individual by comparing protein level in test sample to normal sample, where elevated level of protein in test sample indicates presence of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primer NP2, SEQ ID NO:18, used in human PC-LECTIN cDNA isolation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

contigen, PC-LECTIN (AAB71309) and cDNA encoding it (AAF76004). The expression of the human PC-LECTIN gene is normally restricted to the expression of the human PC-LECTIN gene is normally restricted to the captures and indicate the cancer. PC-LECTIN therefore androgen-independent prostate tumours, and expression is therefore likely cobe dependent prostate tumours compared with androgen-independent prostate cancer. Human PC-LECTIN therefore represents a diagnostic and therapeutic target for prostate cancer. Coparticularly androgen-dependent prostate cancer. Human PC-LECTIN exhibits compared to be the human orthologue of laylin, as diverges significantly in a key functional domain proposed for the laylin coppered to protein. Human PC-LECTIN or nimmunogenic portion thereof, a vector coconic thuman PC-LECTIN antisense nucleotide, a PC-LECTIN concleotide-targetted ribozyme, or an anti- PC-LECTIN antibody may be used to protein-targetted ribozyme, or an anti- PC-LECTIN antibody may be used to protein-targetted ribozyme, or an anti- PC-LECTIN antibody may be used to prepare a composition for treating a patient with a cancer. Colon, pancreatic, testicular, carvical or ovarian cancers that express colon, pancreatic, testicular, carvical or ovarian cancers that express pC-LECTIN proteins are also useful for diagnosing the presence colon, pancreatic, testicular, carvical or ovarian cancers that expressing cancers. PC-LECTIN proteins are also useful for prograte cancer and other PC-LECTIN-expressing cancers. PC-LECTIN corporate cancer and other PC-LECTIN-expressing cancers. PC-LECTIN cancers are useful in the concept of dentify molecules may additionally be used in drug discovery to dentify molecules that modulate PC-LECTIN function or expression. The present sequence represents a PCR primer used in the isolation of human processing cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PC-LECTIN CDNA

Krutwagen RWHH, Voogd E; Goddijn OJM, Verwoerd TC, WPI; 2001-007580/02. Chimeric gene encoding bipartite trehalose synthesis enzyme, useful for producing transgenic plants with increased trehalose content.

Disclosure; Page 16; 59pp; English

The present invention relates to a chimeric gene comprising a potato
patatin promoter and proteinase inhibitor II terminator [PotPiII],
cencoling bipartite trehalose synthesising enzyme and method for
production of trehalose and increasing the level of trehalose
production of trehalose. This bipartite enzyme with trehalose
centendes by trehalase. This bipartite enzyme with trehalose phosphate
cynthase (TPS) and trehalose phosphate phosphates (TPP) activities,
chances the production of trehalose as it enables the completion of
centended to a trehalose and glucose-6-phosphate into trehalose
cat one and the same site. Plants that contain chimeric gene have improved
cat one and the same site. Plants that contain chimeric gene have improved
cat one and the same site. Plants that contain chimeric gene have improved
cat one and the same site. Plants that contain chimeric gene have improved
cresistance to stress (cold or drought) and better post-harvest quality
contains shelf-life. Trehalose is used for forced water extraction, of
creention of natural flavours and mutritional value and allowing rapid
creconstitution, also as e.g. a stabiliset for vaccines, enzymes,
constitution, also as e.g. a stabiliset for vaccines, enzymes,
constitution, also as e.g. a stabiliset for vaccines, chemically inert
contains the present sequence is a TCV 12 oligonucleotide used in the construction of pMOG845 plasmid

Novel gene designated PHOR-1, a G-protein-coupled receptor up-regulated in prostate cancer, useful as diagnostic marker and therapeutic target for cancers of prostate, kidney, uterus.

Example 1, Page 59, 139pp; English.

The invention relates to a novel G-protein-coupled receptor up-regulated in prostate cancer, termed PHOR-1. The encoding cDNA is contained in plasmid designated pl01P3A11 deposited with ATCC as Accession No.PTA-312. PHOR-1 polypeptides and polymucleotides are useful for diagnosing the presence of cancer, especially prostate, kidney, uterine, cervical,

stomach or rectal cancer by determining and comparing the level of the protein or mRNA expression in teet and normal tissue samples. Pharmaceutical compositions comprising PHOR-1 is useful for treating cancer. PHOR-1 proteins are useful for identifying ligands and other agents and cellular constituents that binds to PHOR-1 gene product and for generating antibodies which are useful in diagnostic, prognostic and imaging methodologies and for the treatment of prostate cancer. Cell inse expressing PHOR-1 are useful for identifying protein-protein interactions mediated by PHOR-1. The present sequence represents a primer used in isolation of the PHOR-1 (prostate homologue of olfactory receptor

                                                                                                                                                                                                                                                                                                   The invention is directed to antisense compounds, particularly oligonucleotides which are targetted to a DNA encoding protein phosphatase 18 (PPTB) to modulate its expression. The antisense compounds are useful for diagnosis, prophylaxis and treatment of diseases associated with the expression of PTP1B, to prevent or delay infection, inflammation and tumour formation and as a research reagent. The PTP1B DNA is useful in gene therapy. The present sequence is an antisense oligonucleotide with a phosphorchioate backbone. This oligo is targetted to human PTP1B to inhibit its expression
                                                                                                                                                New antisense compounds capable of modulating expression of human protein phosphatase 1B, useful for diagnosis, prophylaxis and treatment of diseases associated with expression of protein phosphatase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rat; PTP1B; protein phosphatase 1B inhibitor; antisense; gene therapy; infection; inflammation; tumour; prophylaxis; phosphorothioate; ss.

```
The invention is directed to antisense compounds, particularly oligonuclectides which are targetted to a DNA encoding protein phosphatase 1B (PPIB) to modulate its expression. The antisense expension of modulate its expression. The antisense associated with the expression of PTPIB, to prevent or delay infection, inflammation and tumour formation and as a research reagent. The PTPIB DNA is useful in gene therapy. The present sequence is an antisense oligonuclectide with a phosphorchicate backbone. This oligo is targetted to rat PTPIB to inhibit its expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Zebrafish; morphogenic signal; neuron; hedgehog gene; embryonic patterning; cell culture; cell differentiation; ischaemia; cell proliferative disorder; intracerebral grafting; Huntington's chorea;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compounds capable of modulating expression of huma
phosphatase 1B, useful for diagnosis, prophylaxis and treatment
diseases associated with expression of protein phosphatase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    · ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention is directed to antisense compounds, particularly oligonucleotides which are targetted to a DNA encoding protein phosphatase 1B (PPTB) to modulate its expression. The antisense encompounds are useful for diagnosis, prophylaxis and treatment of diseases associated with the expression of PTP1B, to prevent or delay infection, inflammation and tumour formation and as a research reagent. The PTP1B DNA is useful in gene therapy. The present sequence is an antisense oligonucleotide with a phosphorothicate backbone. This oligo is targetted to rat PTP1B to inhibit its expression
                                                                                                                                                                                                                                                                                                                                                 New antisense compounds capable of modulating expression of human protein phosphatase 1B, useful for diagnosis, prophylaxis and treatment of diseases associated with expression of protein phosphatase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rat, PTP1B; protein phosphatase 1B inhibitor; antisense; gene therapy; infection; inflammation; tumour; prophylaxis; phosphorothioate; ss.

Sequence 20 BP; 3 A; 6 C; 2 G; 1 T; 0 U; 8 Other; on 11-SEP-2003 to standardise OS field) AAC887 ద g ઠ The present invention relates to assay for screening compounds that potentiate or inhibit binding of hedgehog polypeptide to naturally occurring patched receptor. The hedgehog protechs comprise morphogenic signals produced by embryonic patterning centres, and are involved in the formation and maintenance of ordered spatial arrangements of formation and maintenance of ordered spatial arrangements of different discussions in the proteins can be used to generate and/or maintain an array of different vertebrate tissues both in vitro and in vivo. The invention also relates to a method for modulating growth, differentiation or survival of a mammalian cell (e.g. neuron, testicular cell) responsive to hedgehog agonists and antegonists can be used in cell culture techniques to enhance survival and maintenance of neurons and various vertebrate organogenic pathways. The hedgehog gene is useful in determining whether a patient is at the risk of disorder characterised by commend cell proliferation or aberrant control of differentiation. The Screening compounds that potentiate or inhibit binding of hedgehog polypeptide to naturally occurring patched receptor, comprises contacting polypeptide with receptor and test compound, and detecting change in binding. hedgehog proteins or mimetics can be used to induce foetal neurons especially neuronal stem cells in intracerebral grafting. The protein or its mimetic can be used in the treatment of neurological conditions e.g. injury to nervous system, ischaemia resulting from stroke, Alzheimer's disease, Parkinson's disease, Huntington's chorea, amyotrophic lateral sclerosis (ALS) and multiple sclerosis. The present sequence is a degenerate PCR primer used to amplify Zebrafish hedgehog gene. The invention relates to nucleic acids encoding hedgehog proteins selected from sonic hedgehog (Shh), indian hedgehog (Ihh), desert hedgehog (Dhh) polypepitales. The hedgehog genes are involved in the formation of ordered spatial arrangements of differentiated tissue in vertebrates. The nucleic acid sequences are useful for producing hedgehog proteins, used for promoting differentiation of, or survival of differentiation on unronal cells, and for promoting proliferation, survival or differentiation of mesenchymal, endodermal or ectodermal tissue, particularly chondrocytes, or testicular germ line cells. Sequences AAH76125-126 represent PCR primers for amplifying a zebrafish Shh genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel nucleic acid encoding a hedgehog polypeptide, used to produce the polypeptide, which is used to promote proliferation, survival, and/or differentiation of neuronal and mesodermal tissue.

```
The nucleic acid sequences represent the 83P5G4 gene and the primers and adaptors used to amplify 83P5G4 DNA. 83P5G4 exhibits prostate specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tumours of the prostate, testis, bladder, kidney, brain, bone, cervix, uterus, ovary, breast, pancreas, stomach, rectum, liver, colon and lung The 83P5G4 polynucleotide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polynucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an single chain monoclonal antibody, that immunospecifically binds to an single-related protein, and a ribozyme capable of cleaving a polynucleotide having the 83P5G4 cading sequence, are both useful in the preparation of a composition for treating a patient with a cancer that cyrpesses 83P5G4. The sequences can be used in diagnostic methods to monitor the level of 83P5G4 gene products in serum, blood, unine and tissue and to thereby detect the presence of cancerous cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                        The present invention relates to antisense compounds up to 30 nucleobases in length targeted to a E2F transcription factor 1 The invention is useful for inhibiting the expression of E2F transcription factor 1 in cells or tissues. The antisense oligomucleotides may also be used as a research agent and to prevent infection, inflammation or tumours

The antisense compounds are useful for diagnostics, therapeutics, prophylaxis and as research reagents or kits. The antisense oligonucleotides are useful for treating human, suspected of having or being prone to a disease or condition associated with the expression of PKA catalytic subunit C-alpha. In particular, the antisense oligonucleotides are useful for preventing, delaying or treating infection, inflammation and tumour formation. They are also useful in antisense therapy. The present sequence is a chimeric antisense oligonucleotide with a phosphorothioate backbone. This oligo is targetted to the cooling region of human PKA catalytic subunit C-alpha to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense oligonucleotides for inhibiting the expression of the human protein kinase A catalytic subunit C-alpha, particularly useful for preventing, delaying or treating infection, inflammation or tumor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention also provides an isolated and/or recombinant nucleic acid or its functional fragment, homologue or derivative, corresponding to a alpha-catenin binding protein. The invention also relates to a novel human zinc finger protein binding with a member of the a-catulin/vinculin family, preferably with a human isoform of alpha N-catenin (neural form). The invention also relates to the field of drug discovery, diagnosis, prognosis and treatment of cancer and neurological disorders. The present sequence is a PCR primer which is used for amplifying human ANC_2HOI CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel recombinant nucleic acids useful for diagnosing, prognosing and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  treating cancer and neurological disorders, corresponds to a protein binding to alpha-catenin protein and with signal transduction function.

The sequence is an antisense oligonucleotide targetting human integrin 4, a procled in autoimmune and inflammatory diseases. The invention relates to antisense inhibitors of integrin alpha 4 which target and inhibit expression of integrin alpha 4 which target and inhibit in the expression of integrin alpha 4 muman cells or tissues, treating an animal having a disease or condition associated with expression of integrin alpha4, e.g., inflammatory disease or condition, autoimmune disease or condition including rheumatod arthritis, militiple solerosis and tumour metastases, melanoma, asthma, psoriasis, alargy, drave's disease, Hashimoto's thyroiditis, systemic lupus erythematosus and allograft rejection, and diseases or conditions enzarerised by leukocyte migration into affected tissues, preferably central nervous system tissues. The antisense molecules are also useful for reducing the reducing the adherence of cells of a first type e.g., melanoma cells or implocytes, to cells of a second type e.g., endothelial cells, by the system tissues are also endothelial cells, by the system transfer of the second type e.g., endothelial cells, by the system transfer of the second type e.g., endothelial cells, by the system transfer of the second type e.g., endothelial cells, by the system transfer of the second type e.g., endothelial cells of a first type e.g., endothelial cells of e.g., endothelial cells of e.g., endothelial cells of e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diseases, comprises encoding integrin

New polynucleotide for treating and diagnosing prostate cancer is the 103P2D6 gene which encodes for 103P2D6-related proteins.

Example 1; Page 55; 132pp; English.

Sequences AAS42193-AAS42208 represent the 101P2D6 gene and the primers and adaptors used to amplify 101P2D6 DNA. 101P2D6 is not expressed in cormal adult tissue but is aberrantly expressed in some foreial tissues and many cancers including tumours of the prostate, testis, bladder, bone, cervix, ovary, breast, pancreas, colon and lung. The 103P2D6 polymuclectide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymuclectide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P2D6. The sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P2D6. The sequences can be used in diagnostic methods to monitor the level of 103P2D6 can be used in diagnostic methods to monitor the level of 103P2D6 gene products in serum, blood, unine and tissue and to thereby detect the presence of cancerous cells

Nucleic acid encoding delta-6-desaturase gene useful for treating atopic eczema, mastalgia, rheumatoid arthritis, Sjogren's syndrome, gastrointestinal disorders, viral infections and post viral fatigue.

Example 4; Page 69; 164pp; English.

The invention relates to polynucleotides that control delta-6 desaturase genes (D6D) and methods useful for identifying compounds which inhibit or promote the activity of mammalian D6D. Compounds which inhibit or segments are useful for treating lipid metabolism disorders e.g. atopic eczema, mastalgia, rheumatoid arthritis, Sjogren's syndrome, gastrointestinal disorders, viral infections and post viral fatigue, premenstrual syndrome, endometriosis, cystic fibrosis, alcoholism, Alzhaimer's syndrome, candiovascular disease, Crohn's disease, cancer, companital livar disease, schizophrenia, diabetes and diabetic complications including diabetic neuropathy, nephropathy and retinopathy. Compounds of the invention are also useful for inhibiting progressive and acute disorders such as arterial hyperthension, atherosolerosis, dhronic inflammatory and autoimmune disorders, hypercholesterolaemia and other atopic disorders. D6D genes are useful in gene therapy. The present acopic else are useful in gene therapy. The present sednence

AAD07091/C ID AAD07091 standard; DNA; 20 BP XX AC AAD07091; XX DT 06-AUG-2001 (first entry)

The present sequence is nested primer (NP2) which is used to isolate the human six transmembrane epithelial antigen of the prostate (STEAP) CDNA fragment generated from suppression subtractive hybridisation (SSE).

STEAP is a member of cell surface serpentine transmembrane antigens.

STEAP gene is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting growth or killing cells expressing STEAP, or inhibiting growth or killing cells expresses STEAP, or inhibiting growth or killing cells expressing to the patient. Treating a patient with a cancer that composition to the patient of the patient or killing cells expressing STEAP, or inhibiting growth or killing cells expressing single chain monoclonal antibody that specifically binds to STEAP, comprises administering to the patient a vector encoding single chain monoclonal antibody coding sequence to the cancer cells and the encoded single chain monoclonal antibody is expressed intracellularly New STEAP (six transmembrane epithelial antigen of the prostate) proteins, expressed in human cancers, useful for detecting and treating NP2 primer used in isolation of STEAP cDNA fragment generated from SSH Human, cytostatic, antiproliferative, vaccine, gene therapy, six transmembrane epithelial antigen of the prostate-1, STEAP-1, prostate; colon, bladder; lung, ovarian; pancreatic, PCR primer; Raitano AB, Saffran DC, Mitchell SC; Example 1; Page 70; 187pp; English. 06-DEC-1999; 99US-00455486. 36-DEC-2000; 2000WO-US033040. RESULT 354 AAS11672/c ID AAS11672 standard; DNA; 20 AAS11672;

Prostate and testis-related gene 84P2A9 cDNA nested primer #2. 24-OCT-2001 (first entry)

84P2A9; PCR primer; DNA adaptor; prostate; testis; tissue; cancer; 88; leuksemia; tumour; kidney; brain; bone; skin; ovary; breast; pancreas; colon; lung; cytostatic; gene therapy; antibody therapy; ribozyme; single chain monoclonal antibody; serum; blood; urine.

The mucleic acid sequences represent the 84P2A9 gene and the primers and adaptors used to amplify 84P2A9 DNA. 84P2A9 exhibits prostate and testis specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including leukaemia and tumnours of the prostate, testis, kidney, brain, bone, skin, ovary, breast, pancreas, colon and lung. The 84P2A9 polymuclectide, its related protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymuclectide which encodes a single chain monoclonal antibody, that immunospecifically binds to an elapaba-related protein, and a ribozyme capable of cleaving a polymuclectide having the 84P2A9 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 84P2A9. The sequences can be used in diagnostic methods to monitor the level of 84P2A9 gene products in serum, blood, urine and tissue and to thereby detect the presence of cancerous cells Levin E, Mitchell SC; New 84P2A9 gene and its encoded protein, useful for diagnosing and treating cancer, e.g. leukemia and cancer of the prostate, testis, kidney, brain or bone, or for eliciting an immune response. The present invention describes a method for monitoring 158P1H4 gene products in a biological sample from a patient who has or is suspected of paving cancer. The method comprises determining the status of 158P1H4 gene products in a tissue sample from an individual, comparing the status of comparing the presence of abbrrant 158P1H4 gene products in a normal sample, and to the status of 158P1H4 gene products in a normal sample, and comparing the presence of abbrrant 158P1H4 gene products in a normal sample, 158P1H4 sequences have cytostatic activity and can be used in vaccine production. 158P1H4 polynucleotides may be used in monitoring genetic abnormalities. The 158P1H4 proteins may be used in monitoring genetic composition of the malignant phenotype, in generating and characterising concidenting the malignant phenotype, in generating and characterising concidenting the malignant phenotype, in generating and characterising concidenting the products in normal versus cancerous tissues and so elucidating the malignant phenotype, in generating and characterising cancer vaccines. Antibodies against 158P1H4 are useful in diagnostic and cytotoxic T lymphocyte (CTL) or helper T lymphocyte (HTL) responses, and simmunological reagence for detecting 158P1H4 expressing cells. The prognostic assays, and imaging methodologies. The 158P1H4 gene has been contacted to chromosome 8q22-q23, and the 158P1H4 gene also described in the present invention as represent sequences used in the present invention contents in sequences used in the present invention and produced to chromosome 8q23 and the 158P1H4 gene also described in the present invention and produces are also described in the present invention.

Monitoring 158P1H4 gene products in biological sample from patient who has or is suspected of having cancer, useful for treating cancer, comprises identifying presence of aberrant 158P1H4 gene products in biological sample.

Example 1; Page 69; 209pp; English.

The present invention describes a method for monitoring 158P1H4 gene products in a biological sample from a patient who has or is suspected of having cancer. The method comprises determining the status of 158P1H4 gene products in a tissue sample from an individual, comparing the status of 158P1H4 gene products in a normal sample, and to the status of 158P1H4 gene products in a normal sample, and control of aberrant 158P1H4 gene products in the sample. IsBP1H4 sequences have cytostatic activity and can be used in vaccine production. 158P1H4 polynucleotides may be used in monitoring genetic abnormalities. The 158P1H4 proteins may be used in monitoring genetic abnormalities. The 158P1H4 proteins may be used in monitoring genetic abnormalities in the 158P1H4 proteins may be used in monitoring genetic abnormalities in the proteins may be used in assessing the status of 158P1H4 gene products in normal versus cancerous tissues and so elucidating the malignant phenotype, in generating and characterising concert that bind to 158P1H4 or its particular domain, and for generating cancer vaccines. Antibodies against 158P1H4 are useful in diagnostic and cytotoxic Tlymphocyte (CTL) or helper Tlymphocyte (HTL) responses, and imaging mading methodologies. The antibodies are particularly useful in bladder cancer diagnostic and prognostic assays, and imaging methodologies. The 158P1H4 gene has been correct concert diagnostic and prognostic assays, and imaging methodologies. The 158P1H4 gene has been concert to chromosome 8922-923, and the 158P1H4 gene also described in the present invention has been located to chromosome 8922-923, and the 158P1H4 gene also described in the present invention has been located to chromosome 8922-923, and the corrections when the present sequences used in the cycen prognostic assays.

Human STAT3 antisense phosphorothioate oligodeoxynucleotide #106.

sTAT3; human; signal transducer and activator of transcription; ss; STAT; antisense gene therapy; Fas-mediated apoptosis; inflammatory disease; autoimmune disease; rheumatoid arthritis; cancer; breast; prostate; head; neck; brain; leukaemia; myeloma; melanoma; lymphoma; apoptosis; antiinflammatory; immunosuppressive; antirheumatic; antiarthritic; cytostatic.

```
The invention relates to antisense compounds targeted to a nucleic acid molecule encoding a signal transducer and activator of transcription (GTAT) protein, specifically STAT3, where the antisense compounds inhibit the expression of STAT3. The antisense squences are useful for inhibiting the expression of STAT3 in cells or tissues, inducing Fas-mediated approasis in cells, and sensitising cells to apoptosis. They are also useful for treating an animal having a disease or condition associated with STAT3. These disorders include inflammatory or autoimmune breast, prostate, brain and head and neck and leukaemias, myelomas, melanomas and lymphomas. Also treatable are human diseases or conditions characterised by a reduction in apoptosis or an insensitivity to apoptotic signals. The sequences of the invention can be used in clinical research, for detecting and determining the role of STAT3 in various cell functions and physiological processes and for diagnosing conditions canced with the expression of STAT3. The sequences represent cDNA encoding human STAT3 and human STAT3 oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound useful for treating and diagnosing inflammatory diseases and cancers, is targeted to a nucleic acid molecule encoding signal transducer and activator of transcription proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 12; Page 18; 21pp; English

Novel antisense compound useful for treating and diagnosing inflammatory diseases and cancers, is targeted to a nucleic acid molecule encoding signal transducer and activator of transcription proteins.

Example 12; Page 18; 21pp; English

The invention relates to antisense compounds targeted to a nucleic acid molecule encoding a signal transducer and activator of transcription (STAMI) protein, specifically STAMI, where the antisense compounds inhibit the expression of STAMI: The antisense squences are useful for the expression of STAMI in cells or tissues, inducing Fasce also useful for associated approtosis in animal having a disease or condition associated with STAMI: These disorders include inflammatory or autoimmune of disease, particularly rheumatorid arthritis, cancers, such as those of the breast, prostate, brain and head and neck and leukaemias, myslomas. Contacterised by a reduction in apoptosis or an insensitivity to cappitude appropriate signals. The sequences of the invention can be used in clinical research, for detecting and determining the role of STAMI in various cell functions and physiological processes and for diagnosing conditions associated with the expression of STAMI: The sequences represent CDNA encoding human STAMI and human STAMI oligonucleotides

Novel antisense compound useful for treating and diagnosing inflammatory diseases and cancers, is targeted to a nucleic acid molecule encoding signal transducer and activator of transcription proteins.

Example 2; Page 13; 21pp; English.

The invention relates to antisense compounds targeted to a nucleic acid molecule encoding a signal transducer and activator of transcription (STAT) by protein, specifically STAT3, where the antisense compounds inhibit the expression of STAT3. The antisense squences are useful for the expression of STAT3 in cells or tissues, inducing Fascalated apoptosis in cells, and sensitising cells to apoptosis. They are also useful for treating an animal having a disease or condition associated with STAT3. These disorders include inflammatory or autoimmune of disease, particularly theumatorid arthritis, cancers, such as those of the breast, prostate, brain and head and neck and leukaemias, myelomas, contacterised by a reduction in apoptosis or an insensitivity to apoptotic signals. The sequences of the invention can be used in clinical cappatic signals. The sequences of the invention can be used in clinical functions and physiological processes and for diagnosing conditions canceding human STAT3 and human STAT3. The sequences represent cDNA encoding human STAT3 and insensited with the expression of STAT3. The sequences represent cDNA encoding human STAT3 aligonucleotides

The invention relates to prognosis or diagnosis of muscular steatosis by measuring the level of a muscular steatosis modulating feator (MSMP) in a human or animal and comparing this with the level in a healthy control. Any difference indicates presence of, or predisposition to, muscular steatosis. The method is particularly used for diagnosis or prognosis of muscular steatosis. The method is particularly used for diagnosis or prognosis of conders in animal breeding. Also (ant) agonists of MSMF can be used to treat, or induce (for increasing the fat content of food) muscular study of diseases and animals. The MSMF markers are also useful in the study of diseases and animals. The MSMF markers are also useful in the atherosciences, wound healing, tumours and amyotrophic lateral sclerosis increasing the programment of the present sequence is a PCR primer used to amplify a MSMF of the invention from its gene
                         Prognosis and diagnosis of muscular steatosis, useful e.g. for selecting animals for breeding, by measuring levels of specific markers, also treating or inducing steatosis.

Novel isolated 55P4H4-related protein encoded by a gene over-expressed in multiple cancers, useful as a diagnostic and/or therapeutic agent for cancer, preferably prostate cancer.

This invention relates to an isolated 55P4H4-related protein encoded by a gene that is over-expressed in multiple cancers. The polypeptide is useful for inducing an immune response to an 55P4H4 protein, providing the protein comprises of at least one T cell or B cell epitope. The immune system cell is a B cell which generates antibodies that specifically bind to the protein or is a T cell, preferably a cytotoxic T. Example 1; Page 54; 160pp; English.

cell (CTC) which kills an autologous cell that expresses the 55P4H4
protein, or a helper T cell (HTL) which secretes cytokines that
callitate the cytotoxic activity of a cytotoxic T lymphocyte. A method
is mentioned which is considered useful for monitoring the presence of
cancer in an individual, where the presence of elevated 55P4H4 mRNA or
protein expression in the test sample relative to the normal tissue
ample provides an indication of the presence or status of a cancer which
course in a prostate, kidney, testis, lung, cervix, bone, bladder, brain

Novel purified and isolated glycoprotein designated ENDO-1, useful as marker for diagnosing endometriosis in female patient suspected of having endometriosis,

Example 7; Page 10; 20pp; English.

PCR primers ABL41837-38 were used to amplify a cDNA fragment of rat endometriotic protein ENDO-1. ENDO-1 is a N-acetyl linked glycoprotein, synthesized and secreted specifically by stromal cells of endometriotic tissue origin. Human ENDO-1 has a molecular weight of 40000-55000 as determined by two-dimensional sodium dodecyl sulphate-polyacrylamide gel electrophoresis (SDS-PAGE), and has an isoelectric point of 4.0-5.5. ENDO-1 is useful as a marker for diagnosing endometriosis in a female patient suspected of having endometriosis. Endometriosis in a female patient be diagnosed by obtaining a sample from the patient, and detecting the

The invention relates to a compound of 8-50 nucleobases in length targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where the compound specifically hybridises with and inhibits the expression of PTP1B (e.g. an antisense oligonucleotide). Also included are (1) a compound of 8-50 nucleobase in length which specifically hybridises with an 8 nucleobase portion of an active site on a nucleic acid encoding PTP1B; (2) inhibiting the expression of FTP1B in cells or tissues comprising contacting the cells or tissues with the compound; treating an animal having or suspected of having a disease or condition associated with PTP1B comprising administering the compound; (4) decreasing blood
                                                                                                                                                                                                                               ö
pTPIB, such as type 2 diabetes, obesity, cancer (especially ovarian cancer, chronic myeloid leukaemia and hyperproliferative diseases in an animal having or suspected of having the disease or condition, and decreasing blood sugar levels or preventing or delaying the onset of an increase in blood glucose levels in an animal. The compound is also used in diagnosetics, herapeutics, prophylaxis, and in research reagents and kits. The present sequence is an antisense compound of the invention targetting rat PTPIB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Compound for inhibiting the expression of protein phosphatase 1B (PTP1B) and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTP1B.
                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense, protein phosphatase 1B; PTP1B; ss. probe, rat;

sugar levels in an animal comprising administering the compound; (5)
preventing or delaying the onset of a disease or condition associated
with PPPIB in an animal comprising administering the compound; and (6)
preventing or delaying the onset of an increase in blood glucose levels
in an animal comprising administering the compound. The compound is used
to inhibit the expression of PPTB in cells or tissues, to treat or
prevent or delay the onset of a disease or condition associated with
PPPIB, such as type 2 diabetes, obesity, cancer (especially ovarian
cancer, chronic myeloid leukaemia and hyperproliferative diseases in an
inmal having or suspected of having the disease or condition, and for
decreasing blood sugar levels or preventing or delaying the onset of an
increase in blood glucose levels in an animal. The compound is also used
in diagnostics, therapeutics, prophylaxis, and in research reagents and
kits. The present sequence is an antisense compound of the invention

Compound for inhibiting the expression of protein phosphatase 1B (PTP1B) and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTP1B.

Example 15; Page 23; 133pp; English.

The invention relates to a compound of 8-50 nucleobases in length targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where the compound specifically hybridises with and inhibits the expression of

CC prplB (e.g. an antisense oligonucleotide). Also included are (1) a compound of 8-50 nucleobases in length which specifically hybridises with a molicebase portion of an active site on a nucleic acid encoding prplB; (2) inhibiting the expression of PrplB in acidis or tissues comprising contacting the cells or tissues with the compound; treating an animal having or suspected of having a disease or condition associated with PTPB comprising administering the compound; (4) decreasing blood sugar levels in an animal comprising administering the compound; (5) preventing or delaying the onset of a disease or condition associated with PTPB in an animal comprising administering the compound; and (6) preventing or delaying the onset of an increase in blood glucose levels or an animal comprising administering the compound; and (6) preventing or delaying the onset of an increase in blood glucose levels or inhibit the expression of PTPIB in cells or tissues, to treat or or prevent or delay the onset of a disease or condition associated with PTPIB, such as type 2 diabetes, obesity, cancer (especially ovarian connect or myelolid leukaemia and hyperproliferative diseases in an animal having or suspected of having the disease or condition, and for decreasing blood sugar levels or preventing or delaying the onset of an increase in blood glucose levels in an animal. The compound is also used in diagnostics, therapeutics, prophylaxis, and in research reagents and thus an animal human PTPIB

New gene designated 34P3D7, encoding a tissue-specific protein highly expressed in prostate cancer, for use as diagnostic and/or therapeutic target for cancers, and for eliciting an immune response.

Example 1, Page 53; 112pp; English.

The invention relates to a polynucleotide, designated 34P3D7, encoding 34P3D7-related protein, comprising a sequence of 2198 nucleotides fully

```
ö
defined in the specification. The presence of elevated 34P3D7 mRNA or protein expression indicates the presence of cancer occurring in prostate, bladder, kidney, brain, bone, cervical, uterine, ovarian, breast, pancreatic, scomach, colon, rectal leukocytes, liver, and lung tissue, and in melanocytes. An antibody against the 34P3D7-related polynucleotide complementary to 34P3D7 polynucleotide, or a ribozyme capable of cleaving the 34P3D7 polynucleotide, or a ribozyme capable of cleaving the 34P3D7 polynucleotide is useful for inhibiting the development of a cancer expressing 34P3D7 in a patient. The present sequence was used in an example demonstrating suppression subtractive hybridisation (SSH)-generated isolation of a cDNA fragment of the 34P3D7 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; calreticulin; antisense compound; hyperproliferative disorder; cancer; autoimmune disease; viral infection; cardiovascular disease; antisense therapy; cytostatic; immunosuppressive; virucide; antisense; phosphorothioate backbone; ss.

The invention relates to antisense compounds, compositions and methods for modulating the expression of calreticulin. The compositions comprise antisense compounds, particularly antisense oligonuclectides, targetted to nucleic acids encoding calreticulin. The antisense compound is useful for inhibiting the expression of calreticulin in human cells or tissues. It is also useful for treating a human having a disease or condition associated with calreticulin, e.g., hyperproliferative disorder e.g. cancer, autoimmune disease, viral infection or cardiovascular disease, by inhibiting expression of calreticulin. It is useful for disposities, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense compound targetted to human calreticulin. This sequence is used to study the antisense inhibition of calreticulin expression-phosphorothioate 2. MOE gapmer oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, 125P5C8; cancer, cytostatic, breast cancer, prostate cancer;

The present invention relates to compositions comprising a substance that modulates the status of 125P5C8 or a molecule that is modulated by 125P5C8. The status of a cell that expresses 125P5C8 is modulated. The composition is useful for treating cancer, particularly prostate, bladder, kidney, colon, ovary or breast cancer. The 125P5C8 protein and/or a nucleotide sequence encoding the protein is useful for immunising a mammal against cancer. The present sequence is a PCR primer shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human/mouse C/EBP phosphorothioate antisense oligonucleotide, SEQ ID:41
                                                                                                              New composition comprising a substance that modulates the status of 125P5C8 gene or a molecule that is modulated by 125P5C8, useful for treating or preventing cancer that expresses or over expresses 125P5C8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, C/BBP alpha; CCAAT/enhancer-binding protein alpha; CEBPA; transcription factor; tissue development; cellular function; prollferation, differentiation, adipocyte; energy metabolism; chondrogenic; ovulation; follicular development; hormonal metabolic regulation; paranlocyte development; hormonal metabolic regulation; granulocyte development; cancer; tumour formation; infection; inflammation; expression inhibition; antisense therapy; quantitative real-time PCR primer; ss.

cothe human CCAAT/enhancer-binding protein alpha (C/EBP alpha) gene, which inhibit it lits expression. The antisense oligonucleotides were designed to target different regions of the human C/EBP alpha Gene, which inhibit it lits expression. The antisense oligonucleotides were designed to target different regions of the human C/EBP alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels by quantitative cap-terme PCR. A similar investigation on mouse C/EBP alpha RNA, and was performed using a subset of the antisense oligonucleotides that were capable of hybridising to mouse C/EBP alpha mRNA. The C/EBP family of proteins are a family of transcription factors which regulate the expression of wide range of genes that control normal tissue development, callular function, of transcription factors which regulate the expression of wide range of genes that control normal differentiation. C/EBP alpha (also known as CEBPA) is primarily found in tissues involved in energy metabolism which have a capacity to metabolise lipids, cholesterol and other sterols. It is thought to be involved in the control and other sterols. It is thought to be involved in follicular development and ovulation, and is also involved in follicular development requisitation of metabolism, and in cycle arrest in the liver, in controlling glucose transporter GUTZ promoter activity, in the hormonal regulation of metabolism, and in cycle arrest the acvelopment and ovulation, of metabolism, and in cycle arrest of diagnosis, prevention and treatment of conditions associated with the anametric conditions or the condition, or the anametric conditions or the condition or the condition or conditions associated with the condition and the conditions associated with the condition and the conditions of the condition or conditions associated with the condition of the condition of the condition of the conditions associated with 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               colon; lung;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       103P3E8; PCR primer; DNA adaptor; prostate; bladder; kidney; colon; lbreast; rectum; stomach; tumour; cancer; cytostatic; gene therapy; sf antibody therapy; ribozyme; single chain monoclonal antibody; serum; blood; urine; tissue; human; chromosome 9q13-q21.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠ
Sequences AAS95810-AAS95820 represent the 103P3E8 gene and the primers and adaptors used to amplify 103P3E8 DNA. 103P3E8 exhibits tissue specific expression in normal adult tissue, but it is also aberrantly expressed in many cancers including tummours of the prostate, bladder, kidney, colon, lung, breast, rectum and stomach. The 103P3E8 bladder, kidney, colon, lung, breast, rectum and stomach. The 103P3E8 bladder, comprising a polymucleotide protein and also peptide fragments of the protein are therefore useful for diagnosing and treating cancer. A vector comprising a polymucleotide which encodes a single chain monoclonal antibody, that immunospecifically binds to an 103P3E8 related protein, and a ribozyme capable of cleaving a polymucleotide having the 103P3E8 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 103P3E8. The sequences can desired in diagnostic methods to monitor the level of 103P3E8 gene products in serum, blood, urine and tissue and to thereby detect the presence of cancerous cells

The invention relates to an isolated 98P7C3-related protein which is a homeodomain protein highly expressed in various cancers. Also include are homeodomain protein highly expressed in various cancers. Also include are polymucleotides encoding the protein or proteins 90% identical to 98P7C3, a pharmaceutical composition comprising the polymucleotides (including an expression vector comprising the 98P7C3 encoding polymucleotides) or a comparation or polymucleotides in a biological sample, monitoring the 98P7C3 protein or polymucleotides in a biological sample, monitoring the 98P7C3 protein or polymucleotides and a pharmaceutical composition comprising a modulator of 98P7C3. 98P7C3 protein, or T cell/B cell composition or polymucleotides and a pharmaceutical composition comprising a modulator of 98P7C3. 98P7C3 protein, or T cell/B cell composition in immunogens derived from it, are useful in inducing an immune response (in mammal) to a 98P7C3 protein. Upon contact with a cytocoxic T cell (CTL) the immunogens induce the CTL (with its helper T cell) to kill an exposit of cucoding the protein or epitope. The antibody is useful for delivering a cytocoxic agent to the antibody or its fragment that specifically binds crocaling the protein or epitope. The antibody is useful for delivering a cytocoxic agent to the antibody or its fragment that specifically binds conjugate. The modulator is useful for treating a patient with a cancer conjugate. The modulator is useful for treating a patient with a cancer conjugate. The modulator and colon cancer, bladder cancer, kidney cancer, breate cancer, breater sequence is objected on human chromosome 4q11-q12. The hubble of conjugation cancer is objected by the m
                                                                                                                                                                               New isolated 98P7C3-related homeodomain protein highly expressed in various cancers, useful in cancer vaccines and for generating immune response directed to 98P7C3 in mammal.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) a clones of the genomic libraries contained in mittiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultent amplified product to specify the discrimination Nos. of the multiwell containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell containination Nos. are mixed clones are cultured and the call altertions; (f) the mixed clones are cultured and the call altertions; (f) the mixed clones are cultured and the call altertions are applified by using the above primer; (g) signals replates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and arrayed. The constituted as the positions on the chromosome and arrayed. Novel antisense compound useful for treating type 2 diabetes, cancer and obssity, is targeted to nucleic acid encoding human protein phosphatase 18, and hybridizes and inhibits PTP18 expression.

Example 15; Page 67; 142pp; English.

The invention relates to a compound targeted to a nucleic acid molecule encoding procein phosphatase 1B (PTP1B), which specifically hybridises with and inhibite the expression of PTP1B. The compounds of the invention are useful for inhibiting the expression of PTP1B in liver, kidney or adipose cells or tissues and for treating an animal, preferably human, having a disease or conditions, e.g. type 2 diabetes and obesity, and is associated with PTP1B, including metabolic hyperproliferative conditions such as cancer. The sequences are also useful for decreasing blood (serum or plasma) glucose levels in an animal e.g. a diabetic human or rodent, for preventing or delaying the onset of a disease or condition associated with PTP1B, and for preventing or delaying the onset of an increase in blood glucose levels. This sequence represents a PTP1B mRNA level inhibition antisense oligonucleotide of the invention

Detecting the presence of Mycobacterium tuberculosis in a test sample, comprises inducing mRNA expression of Mycobacterium tuberculosis and detecting the induced mRNA.

Claim 8; Page 14; 70pp; English.

The invention comprises a method for detecting the presence of a microorganism (particularly Mycobacterium tuberculosis) in a test sample. The method of the invention comprises exposing the test sample to an inducer that is capable of inducing the expression of at least one gene in the micro-organism and then testing for the presence of mRNA from this gene. The method of the invention is useful for detecting an mRNA that is expressed in a species of Mycobacterium (e.g. Mycobacterium tuberculosis). The present DNA sequence represents a Mycobacterium specific nucleotide which can be used as a primer or probe in the method the invention

Example 2; Page 4; 35pp; English

The invention discloses an adenoviral vector for the selective expression of a toxin gene in a cancer cell. The toxin gene is operably linked to a promoter of a gene with undetectable expression in liver, so that expression of the toxin gene is reduced in liver cells. Adenoviral expression of the toxin gene is reduced in liver cells. Adenoviral vectors and adenoviral gene therapy have been used to introduce suicide/toxic genes to advanced gastrointestinal or pencreatic cancer cells. This technique has a problem due to the hepatotropism of the adenovirals for systemically administered adenoviral vectors localise comprised to the liver, where the suicide gene therapy of intrahepatic tumour leads to severe liver dysfunction. Cyclooxygenase-2 (Cox-2) has virtually undetectable expression in most tissues, but is closely linked to recrinogenesis and progression of colon cancers. The promoter of Cox-2 therefore has a tumour "on" liver "off" expression profile, which can be utilised in the adenoviral gene therapy vectors. The adenovirus is used to the liver dysfunction cancer cells. The adenovirus is used to satrointestinal or pancreatic cancer cells. The expression corrected the antisense PCR primer which was used to amplify glyceraldehyde-3. profile of cyclooxygenase-2 (Cox-2) cDNA in various tissues

The invention comprises antisense oligonucleotides designed to inhibit expression of Syntaxin 4 interacting protein. The antisense oligonucleotides of the invention are useful for inhibiting the expression of Syntaxin 4 interacting protein in cells or tissues. The antisense oligonucleotides are also useful for treating an animal having a disease or condition associated with Syntaxin 4 interacting protein (e.g. diabetes, obesity or a skeletal muscle disorder). The antisense oligonucleotides can also be used to prevent or delay infection, inflammation and tumour formation. The present DNA sequence represents a human Syntaxin 4 interacting protein antisense oligonucleotide. NoTE: The methoxyethyl wings

Novel antisense compound that hybridizes and inhibits nucleic acid molecule encoding Syntaxin 4 interacting protein, useful for treating diabetes, obesity and skeletal muscle disorder.

Wyatt JR; Zhang H, WPI; 2002-393838/42.

Novel antisense compound targeted to nucleic acid molecule encoding the BH3 interacting domain death agonist, useful for treating animals with diseases associated with BH3 interacting domain death agonist, e.g. hepatitis.

Claim 3; Page 87; 171pp; English.

The invention relates to a compound 8 to 50 nucleotides in length
targeted to a nucleic acid molecule encoding a BH3 interacting domain
death agonist, where the compound specifically hybridises with and
inhibits the expression of the BH3 interacting domain death agonist. The
compound of the invention is useful for inhibiting the expression of the
BH3 interacting domain death agonist in cells or tissues. The compound is
also useful for treating an animal having a disease or condition
associated with the BH3 interacting domain death agonist, e.g.
cassociated with the BH3 interacting domain death agonist, e.g.
disorder, immunological disorder, or a disease or condition of the liver
cissue full for dispositios, therapeutics, prophylaxis and as research
creagents and kits. This polynucleotide sequence represents an antisense
coligonucleotide inhibitor of the DNA from human BH3 interacting domain
death agonist RNA of the invention. NOTE: This sequence is a diffmentic
coligonucleotide wings'. The wings are composed of 2' methoxyethyl (2'
"NOE) nucleotides. The internucleoside (backbone) linkages are
chosp nucleotides. The internucleoside (backbone) linkages are
chosp nucleotides. The internucleoside (backbone) linkages are
cologia to standardise OS field)

Butler MM, Wyatt J; Monia BP,

WPI; 2002-214451/27.

Novel antisense compound targeted to nucleic acids encoding human or mouse CCAAT/enhancer binding protein (C/EBP) beta, useful in vitro for inhibiting expression of human or mouse C/EBP beta in cells/tissues.

Claim 1; Col 42; 69pp; English.

Sequences AB194252-AB194476 represent antisense oligonucleotides targeted to the human or mouse CCAAT/enhancer-binding protein alpha (C/BBP alpha) and which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human and/or mouse C/BBP alpha NA, and were analysed for their effect on C/BBP alpha mRNA levels alpha RNA, and were analysed for their effect on C/BBP alpha mRNA levels control tormal tissue development, cellular function, cellular control normal tissue development, cellular function, cellular control and functional differentiation and series responses control and processed and series has beta is control and its a mediator of IL-6 (incerleuke) signalling. C/BBP beta is control cound in the lung. It is also expressed at a higher conditions are useful for diagnosis, prevention and treatment of impairment of insulin secretion in type II diabetes. The oligonucleotides conditions associated with C/BBP beta expression, guch as cancer conditions associated with C/BBP beta expression, guch as cancer conditions associated with C/BBP beta expression, guch as cancer conditions or inflammation. Guabetes (particularly very Inflammation.)

Monitoring 83P2H3 gene products for monitoring the presence of cancer in a subject, comprises determining the status of 83P2H3 gene products in a tissue sample from the subject and comparing it to a normal sample.

Example 1; Page 76; 270pp; English.

The invention relates to monitoring 83P2H3 (a calcium transport protein whose gene is located on chromosome 7q34) gene products in a biological eargiele from a parient who has or is suspected of having cancer cancer), comparige (a) determining the status of 83P2H3 gene products expressed by calls in a tissue sample from an individual and (b) compariging the status to the status of 83P2H3 gene products in a normal sample. Also included are modulators of 83P2H3 function or status, generating antibodies/immune response against 83P2H3 conjugating the agent to an entigen) binding peptides derived from the protein delivering a cytotoxic agent to a cell cypridom that produces the recombinant protein, a non-human transgenic animal that produces the recombinant protein, a non-human transgenic animal that produces the recombinant protein, a non-human of the anti-83P2H3 antibody, a vector comprising a non-human of the anti-83P2H3 antibody, a vector comprising a non-conformal antibody that comprises the wortable domains of the havy and inducing the presence of cancer in an individual. The modulator is monitoring the presence of cancer in an individual. The modulator is cancer that expresses 83P2H3. The immunological methods are useful for cancer that expresses 83P2H3. The immunological methods are useful for

```
ö
generating an immune response against 83P2H3, and for detecting the presence of 83P2H3-related protein or polynuclectide in a biological sample from a patient who has or who is suspected of having cancer. The antibody is useful in prostate cancer diagnosis, prognosis, imaging methodologies and treatment, to detect and quantify 83P2H3 and mutant 83P2H3-related proteins, for purifying a 83P2H3-related protein, for isolating 83P2H3 homologues/related molecules, and for generating antidiotypic antibodies that mimic the 83P2H3 protein. The present sequence is a PCR primer used in the isolation of cDNA encoding 83P2H3 or its related protein CaTrF2EH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to a composition comprising a substance that modulate the status of 85P1B3, where the status of a cell expresses 85P1B3 gene product is modulated. Also included are a composition comprising a perduct is modulated. Also includes an as position, an any whole number increment up to 229 that includes an as position any whole number increment up to 229 that includes an as position. It has been a position having a value greater than 0.5 in the percent accessible residue profile, an as position having a value greater than 0.5 in the average flexibility profile; an as position having a value greater than 0.5 in the average flexibility profile; an as position having a value greater than 0.5 in the average flexibility profile; or an as position having a value greater than 0.5 in the becareful average flexibility profile; a polymucleotide that encodes analogue peptide of 8, 9, 10 or 11 contiguous residues of the 85P1B3 protein; a recombinant protein comprising the antigen-binding region of a monoclonal antibody; a non-human transgenic animal that produces an antibody that binds to the 85P1B3 protein; a Composition for modulating the status of 8571B3 protein or a molecule comprising a substance e.g. antibody specific to, nucleic acid encoding, or ribozyme of 8571B3. Example 1; Page 76; 201pp; English.

hybridoma that produces antibody specific to the protein; a single chain monoclonal antibody (MAb) that comprises the variable domains of the heart and monoclonal antibodies specific to the protein; a vector comprising a polymucleotide that encodes the MAb; inhibiting growth of cancer cells or treating a patient who bears cancer cells that expresses the protein, antibody, polymucleotide encoding the protein, antibody polymucleotide cancer cells that cleaves the polymucleotide and T cells that specifically risocomize the protein; and generating a mammalian immune response directed to the protein and generating a mammalian immune system to an immunogenic portion of the protein or polymucleotide. The composition, which comprises an antibody specific to the protein, is useful for delivering a cytocoxic agent to a cell that expresses the protein by providing a cytocoxic agent to acell that expresses the protein by conjuding a cytocoxic agent to acell that expresses the protein for the mattibody and exposing the cell to the antibody-agent conjugate. The methods are useful for inhibiting crowth of cancer cells or treating a mammalian immune response expresses the protein, for detecting the presence of the protein or polymucleotide in a biological sample in a patient who has or who is suspected of having cancer and for monitoring SPIRB3 in a biological sample from a patient who has or who is sample from a patient who has or who is sample for mere do numan chromsome 15q14. Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.

Example 5; Fig 29; 300pp; English.

The present invention describes a method (M1) for designing capture

cc oligonucleotide probes (I) for use on a support to which complementary cligonucleotide probes (II) will hybridise with little mismatch, where cligonucleotide probes (II) will hybridise with little mismatch, where cc (I) have melting temperatures within a narrow trange. The method is useful cc e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents cc c.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents cc fifteetious agents cc rypteococcus nectormans, Candinesia albicans and cc speciallus funigautus, viruses e.g. T-cell lymphocytotrophis citus, Epstein-Barr virus and pollo virus, and parasitic infectious agents cancer from Onchoverva volvulus, Entamoeba histolytica and Dracumculus can as 1 hydroxylase deficiency, Turner Syndrome and obesity defects.

Cc alected from Onchoverva volvulus, Entamoeba histolytica and Dracumculus cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, buman papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the cc presence or absence of the target mucleotide sequences. New compositions comprising a gene (designated 158P1D7), its encoded protein or their modulators, useful for treating or diagnosing cancers, particularly bladder cancer, in mammals (e.g. dogs, cats, cows, horses or numans) 

Example 1; Page 68; 181pp; English

The invention relates to a novel nucleic acid, designated 158P1D7. The compositions are useful for treating or diagnosing cancers, particularly bladder cancer, in mammals (e.g. mice, rats, rabbits, dogs, cats, cows, horses or humans). The compositions are also useful for monitoring genetic abnormalities and in preparing cancer vaccines. The nucleic acid of the invention can be used in gene therapy to treat the said disorders. This polynucleotide sequence represents a PCR primer of the 158F1D7 CDNA of the invention 888888888888

Composition comprising a substance that modulates the status of a zinc transporter protein (108P5H8), useful in diagnosing and treating patients with cancer that express 108P5H8, such as breast, colon, ovarian or lung cancer.

Example 1; Page 95; 309pp; English.

The invention relates to a new composition comprising a substance that modulates the status of a zinc transporter protein, designated as modulates. The composition is 108P5H8, or a molecula that is modulated by 108P5H8. The composition is useful in diagnosing, preventing, prognosticating or treating patients with cancer that expresses 108P5H8, such as breast, colon, ovarian or lung cancer. The 108P5H8 ene or its fragment can be used to elicit a humoral or cellular immune response. The antibodies are useful in active or passive immunisation. The 108P5H8 polymucleotides are useful in active and primers for the amplification or detection of 108P5H8 genes, as coding sequences for directing the expression of 108P5H8 genes. The polymucleotides of the invention can be used to treat disorders by gene therapy. This polymucleotide sequence represents a zinc transporter protein 108P5H8 related PCR primer of the invention

```
The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polymucleotides are useful for characterising cytogenetic abnormalities of this chromosomal cours, as tools that can be used to delineate cytogenetic abnormalities of in the chromosomal region that encodes 121P2A3 that may contribute to in the chromosomal region that encodes 121P2A3 that may contribute to in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The present sequence represents an nested for the management of cancer. The present sequence represents an nested CPC suppression subtractive hybridisation (SSH) reactions
                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a new composition comprising a substance that modulates the status of 158P3D2 or a molecule that is modulated by 158P3D2, where the status of a cell that expresses 158P3D2 is modulated. The composition is useful for treating cancer. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New composition comprising a substance that modulates the status of 15893D2 or a molecule that is modulated by 15893D2, useful for treating

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 13919; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intifiation codon, coding region, 5. or 3. end genomic flanking regions, 5. and 3. intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal alraway dysfunction and a second active agent comprising an antiinflammatory steroid and ubjquinone. A composition of the invention has antiinflammatory, antiallargic, antisthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition may have a cust in antiallammatory steroid in a subject, for reducing or depleting levels of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or receptor, producing bronchodilation, increasing levels of ubjquinone or lung surfactant in a subject, to receptor, producing bronchodilation, increasing levels of ubjquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences

Aguilar D; Katz E, Pabalan J, Li Y, Sandrasagra A, Ka , Tang L, Shahabuddin S; Miller S, Nyce JW,

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

claim 15, SEQ ID NO 1597; 872pp; English.

first active agent comprising an oligonuclectide antisense to the invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genemic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antinflammatory steroid and ubjusione. A composition of the invention has antinflammatory, antiallergic, antisthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a creventing a respiratory, lung or malignant disease or condition, also preventing the prophylactic or therapeutic respiratory effect of an antisflammatory steroid in a subject, for reducing levels of denosine of or, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Pharmaceutical composition for treating allments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 14611; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory teroid and ubiquinone. A composition of the invention has antiinflammatory steroid and ubiquinone. A composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an autistic ammatory steroid in a subject, for reducing levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject stissue, or treating bronchocomstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed of specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Aguilar Li Y, Sandrasagra A, Katz E, Pabalan J, Tang L, Shahabuddin S; Nyce JW, I Miller S,

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure, SEQ ID NO 7616, 872pp, English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomucleotide antisense to the initiation codon, coding region, 5' or 3' or and genomic flanking regions; 5' and 3' intron-exon junctions, 5' or 3' or and genomic flanking regions; 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antistanatory, inng or malignant disease or condition, as so preventing a repliratory, inng or malignant disease or condition, as so in a reducing sensitivity to adenosine, reducing or depleting levels of adenosine receptor, producing bronchodialaion, increasing bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease; or condition or lung surfactant in a subject's tissue, or treating bronchoconstriction, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

New antisense oligonucleotides for modulating insulin-like growth factor binding protein 5 gene expression, useful for preventing or treating cancers, inflammatory disorders, developmental disorders or metabolic cancers, ir disorders.

Claim 3; Page 76; 105pp; English.

Sequences ACC47637.ACC47667 represent phosphorothicate antisense cligonuclectides targeted to the human insulin-like growth factor binding protein 5 (IGFBPS) gane, which inhibit its expression. The antisense coligonuclectides were designed to target different regions of human coligonuclectides were designed to target different regions of human (IGFBPS RNA, and were analysed for their effect on IGFBPS) is a member of quantitative real-time PGR. IGFBPS (also known as IBPS) is a member of the insulin-like growth factor superfamily, which are involved in the crequiation of IGF action and bioavailabilty, and which also mediate IGFP independent actions, including inhibition or enhancement of apoptosis. IGFBPS is a key component of the IGF system in bone, having a high specific binding affinity for hydroxyapatite and extracellular matrix specific binding affinity for hydroxyapatite and extracellular matrix of specific binding affinity for hydroxyapatite and extracellular matrix of their an independent mechanism. IGFBPS is also expressed in other tissues, such as kidney, liver gut endothelium, lung tubules and other tissues, such as kidney, liver gut endothelium, lung tubules and other tissues, notechord, muscle cells in prostate cancer of colitis. It is also thought to play a role in prostate cancer of colitis. It is expressed with high frequency in neuroendocrine tumours, and has been shown to be induced in breast cancer cells upon treatment of progracledorides of the invention and treatment of information and treatment of information and treatment of information are useful for diagnosis, the propression is propressed in hyperproliferative disorders (particularly cancers of the breast, propertion and treatment of information are useful for diagnosis, or prosteders (e.g., colities) developmental or growth disorders (e.g., diabetes, colities, or osteoperosis)

Novel isolated antigenic peptide comprising amino acid residues of CH3 domain of IgE molecule from first species and a second unrelated species, induces non-anaphylactic anti-IgE immune response in animal.

Example 2; Page 22; 50pp; English.

This invention describes a novel antigenic peptide comprising amino acid residues of an IgB CH3 domain from a first species (ADE1) and amino acid residues of an IgB CH3 domain from a first species (ADE2), where ADE1 is conserved in the IgE CH3 domain of the second apecies and ADE2 is not conserved in the IgE CH3 domain of the second apecies and ADE2 is antigenic peptide induces a non-anaphylactic anti-IgE immune response in a national. The invention also discloses the polynucleotide sequence conciding the antigenic peptide and an antigenic fusion protein comprising the antigenic peptide of the invention and a heterologous protein comprising the antigenic peptide of the invention and a heterologous protein comprision carrier, where the fusion protein induces an anti-IgE immune response that does not cause anaphylaxis when administered to an animal. The corputors of the invention have dermatological, antiinflammatory and ophthalmological activity. The antigenic peptide described is capable of products of the invention are useful in the manufacture of a medicament for treating or preventing IgE-mediated allergic disorders including asthma, allergic rhinitis, gastrointestinal allergic disorders including asthma, allergic rhinitis, gastrointestinal allergic disorders consoluted products are useful for treating IgE-mediated allergic disorders by gene therapy. Antigenic peptides comprising conserved amino conditive by variable amino acid residues of the CH3 domain of an IgE molecule from ans species cald residues of fanti-IgE antibodies when administered to an animal without causing anaphylaxis. ACAS5184-ACAS5346 represent PCR primers used to amplify the polymucleotide sequences used in designing the constructs causing anaphylaxis. ACAS5184-PEPESET Conserved in the disclosure of the invention

```
The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding dual specific phosphatese 5, where the compound specifically hybridises with and inhibits the expression of dual specific phosphatese 5. The compound is used for treating an animal having a disease or condition associated with dual specific phosphatese 5 such as a hyperproliferative disorder, a developmental disorder, an inflammatory disorder or a disease which arises from aberrant apoptosis. Sequences ARX09062-ABX09139 represent human dual specific phosphatese 5 phosphorothioate oligonucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; immunostimulant; 162P1E6; cytotoxic agent; immune response; cancer; bladder; prostate; kidney; lung; breast; passive immunisation; transgenic animal; vaccine; gene therapy; PCR; primer; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel composition comprising a substance that modulates the status of a 1519304 protein (e.g. 1519304 variant 1-11; or a molecule that is modulated by the 1519304 protein, where the status of compositions, or the 1519304 protein is modulated. The novel compositions, or the 1519304 proteins and genes, are useful for eliciting a humoural or cellular immune response. The 1519304 genes and proteins are also useful for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladdar cancer, colorectal cancer, lung or bronchial cancer, breast cancer or carcinoma. This polymucleotide sequence represents a 1519304 related primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New 151P3D4 proteins and genes, useful for eliciting a humoral or cellular immune response, or for diagnosing, prognosing, preventing or treating cancer, e.g. adenocarcinoma, bladder cancer, lung, breast cancer

The invention relates to a novel composition comprising a substance that modulates the status of a 162P1E6 protein. The protein comprises one of 21 sequences of 70 - 146 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of a cell that expresses the protein is modulated. An antibody to the 162P1E6 protein is used to deliver a cytotoxic agent or a diagnostic agent to a cell that expresses the 162P1E6 protein. The composition is used for centering the presence of a 162P1E6 related protein or a 162P1E6 related protein as 162P1E6 related proteins and polymuclectide in a sample. The 162P1E6 proteins and polymuclectide in a sample. The 162P1E6 proteins and polymuclectide senceding them are useful for diagnosing, proteins and polymuclectides encoding them are useful for adaptosing, prostate cancer, kidney cancer, lung cancer, or breast cancer. They can also be used for eliciting a humoral or cellular immune response. The mutibodies or T cells reactive with 162P1E6 are useful for active or passive immunisation. Transgenic animals are useful for developing and screening of useful reagents. The polymuclectide and polympetide cancer of the invention can also be used to treat disorders by being used in a vaccine or in gene therapy. This polymuclectide sequence
                                                                                                                                                                                                                                                                                                                                                              Composition for diagnosing, prognosing, preventing or treating cancer, for eliciting a humoral or cellular immune response, or for active or passive immunization, comprises a substance that modulates the status of

Suppressive subtractive hybridisation of STEAP related primer #8.

STEAP-1; six transmembrane epithelial antigen of the prostate; cancer; cancer vaccine; delineation; cytogenetic abnormality; cytostatic; vaccine; PCR; primer; ss.

Homo sapiens

WO2003022995-A2.

```
The invention describes a composition comprising a substance that modulates the status of a protein (1) of 340 or 283 amino acids, or of any of the 15 sequences of 259 amino acids, given in the specification, or a molecule that is modulated by the protein, where the status of the cell that expresses the protein is modulated. The compositions, proteins, polynucleotides and methods are useful for treating and detecting cancer. The STEAP-1-related proteins are useful for generating cancer vaccines. The polynucleotides are useful as tools for delineating, with greater precision, cytogenetic abnormalities in the chromosomal region that encodes STEAP-1 that may contribute to the malignant phenotype. This sequence represents a primer used to analyse human six transmembrane epithelial antigen of the prostate or STEAP-1 cDNA's
                                                                                                                                                                                                                                                                 New composition comprising a substance that modulates the status of STEAP-1-related protein, useful for treating and detecting cancer.

Hubert RS; Ge ≅ A, Challita-Eid PM, Faris M, Morrison RK, Raitano AB;

New composition comprising a substance that modulates the structure of proteins and polynucleotides, useful for therapeutic, prognostic and diagnostic reagents for eliciting cellular or humoral immune response in cancer patients.

Example 1; Page 72; 1021pp; English.

The present invention relates to novel human cancer-related genes and proteins (ABZ78120-ABZ78168 and ABR01789-ABR01861). The genes and proteins are useful for eliciting a humoral or cellular immune response. The genes are useful as probes and primers for the amplification and/or detection of genes, mRNAs or their fragments, as reagents for the detection of genes, mRNAs or their fragments, as reagents for the diagnosis and/or prognosis of cancer, as coding sequences capable of directing the expression of the protein, as tools for modulating or inhibiting the expression of genes and/or translation of transcripts, and as therapeutic agents. The proteins and peptides are useful as therapeutic, prognostic and diagnostic reagents for cancer. The present sequence is a primer, used in an example from the invention

Challita-Eid

New pharmaceutical composition for diagnosing, prognosing, preventing or treating cancer, comprises a substance that modulates a nucleic acid sequence, e.g. 105P1B7, 152P1A2B or 156P3A6, or a molecule modulated by the nucleic acid.

ğ

The invention comprises the amino acid and coding sequence of a 184PIE2 protein. The DNA and protein sequences of the invention are useful for diagnosing, prognosing and/or treating cancer. The 184PIE2 DNA and protein sequences may also be used to elicit a humoral or a cellular immune response in patients and in monitoring genetic abnormalities. Antibodies raised against the 184PIE2 proteins may be use in active or passive immunisation. The present DNA sequence is used in the exemplification of the invention

Example 1, Page 69; 394pp; English.

Example 1, Page 34; 72pp; English.

The present invention relates to a pharmaceutical composition comprising a substance that modulates the status of a cancer associated mucleic acid sequence such as given in the specification (see ABZ20564-ABZ20575) or a molecule that is modulated by the above nucleic acid sequence, where the

status of a cell that expresses the nucleic acid sequence is modulated. The composition is useful in diagnosing, prognosing, preventing and/or treating ancer. The nucleic acid sequence may be used in monitoring genetic abnormalities, in generating and characteriaing domain-specific antibodies, for identifying agents or cellular factors that bind to a protein, and in therapeutic and diagnostic contexts, such as diagnostic seasys, cancer vaccines, and methods of preparing vaccines. The present sequence is a primer used to identify the cancer associated coding sequences suitable to be modulated in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful for

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3) ACH, UTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorateds. bone long, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                             1..20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a compound (1) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding BCL2-associated X (BAX) procein, where the compound specifically hybridises with the nucleic acid molecule encoding BAX protein and inhibits the expression of BAX protein. The compound specifically hybridises with at least 8-nucleobase portion of an active site on a nucleic acid molecule encoding BAX protein. Also described: (1) a composition comprising (1) and a pharmaceutical carrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compounds, useful for modulating the expression of BCL2-associated X (BAX) protein or for treating a disease or condition associated with BAX protein, e.g. Parkinson's disease, Hodgkin's disease or Alzheimer's disease.

tissues comprising contacting the expression of BAX protein in cells or tissues comprising contacting the cells or tissues with (I); and (3) creating an animal having a disease or condition associated with BAX protein comprising administering to the animal (I) so that expression of BAX protein is inhibited. (I) has nootropic, neuroprotective, antiparkinsonian, anticonvulsant, ophthalmological, antidabetic and virudde activities, and can be used in antissense therapy, and as a BAX cragonist. The antissense compounds (I) are useful for modulating the expression of BAX protein, and for treating a disease or condition associated with BAX protein, e.g. familial amylotrophic lateral cartiage-hair hyperplasia, disbetes-associated ocular disorders or scrapie infection, or a condition that arises from abbrrant apoptosis. The compounds are useful as research reagents and in diagnostics. The present sequence represents a human BAX chimeric phosphorothioate oligonucleotide, which is used in an example from the present invention.

Modulating growth, differentiation or survival of a cell, useful for treating a degenerative disorder of the nervous system characterized by neuronal cell death, comprises contacting the cell with a hedgehog polypeptide.

Example 4; Page 44; 121pp; English

The invention relates to a method for modulating growth, differentiation or survival of a cell, comprising contacting the cell with a hedgehog polypeptide. The invention also relates to methods for inducing a cell to differentiate to a neuronal cell phenotype comprising a cell to differentiate to a neuronal cell phenotype comprising contacting a cell to carget tissue of a hedgehog polypeptide comprising a degenerative disorder of the nervous system characterised by neuronal cell death, comprising administering a hedgehog polypeptide causing prolonged survival of neural cells in the patient, relative to the absence of hedgehog treatment. The hedgehog polypeptide causing prolonged survival of neural cells in the patient, relative to the absence of hedgehog treatment. The hedgehog polypeptides are useful for treating a degenerative disorder of the nervous system characterised by neuronal cell death, including contents a clerosis, pick's disease, Parkinson's disease, amyotrophic specifically Alzheimer's disease, Parkinson's disease, multiple contents and correction associated with a natural aging process. The neuronal degeneration associated with a natural aging process. The neuronal degeneration associated with a natural aging process. The collisor including disorders affecting innervation of smooth muscle and disorders affecting innervation of smooth muscle and peripheral nerve damage, for treating neoplastic or hyperplastic carriythmias which and peripheral nerve damage, for treating neoplastic or hyperplastic carriythmias which and peripheral nerve damage, for treating neoplastic or hyperplastic carriythmia such a degeneration as disease. See the cells of the heart, in nerve proscheses for repairing central cargine from a degeneration of the digestive tract, liver and other organs. This sequence represents a PCR primer used to amplify zebrafish %\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

rng.res

The present invention describes a human sulfatase enzyme (I), which is located on chromosome X (more specifically to Xp22.33). (I) has cardiant, concreptor, cytostatic, neuroprotective, antiparkinsonian, analgesic, cerebroprotective, cardiovascular, antiarrhythmic, antianeamic, cerebroprotective, cardiovascular, antiarrhythmic, antianeamic, activities, and can be used in gene therapy. The sulfatase polymucleotide and polypeptide sequences can be used in diagnosing, preventing, ameliorating or treating diseases associated with sulfatase dysfunction. They may also be used to identify test compounds that may act, for example, as activators or inhibitors at the enzyme's active site. The human sulfatase and its fragments are also useful in raising specific antibodies that can block the enzyme and effectively reduce its activity. The sulfatase can be used as hybridiation probes or primers. The sulfatase can be used as hybridiation probes or primers. The sulfatase can be used as hybridiation probes or primers. The sulfatase can be used in the treatment of diseases such as cancer, a central nervous system (CNS) disorder (e.g. Alzheimer's disease, concer, a disorder (e.g. heart failure or arrhythmias), a haematological disorder (e.g. anaemia or thrombocytopaenia), a genitourinary disorder (e.g. renal failure) obstructive pulmonary disease (COPD) or asthma. The present sequence represents a probe for human sulfatase, which is used in an example from the present invention New polynucleotide encoding a sulfatase polypeptide, useful for diagnosing, preventing or treating diseases associated with sulfatase dysfunction, e.g. cancer, asthma or cardiovascular disorders. New antisense compounds, useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha, and for treating a disease or condition associated with expression of PKA regulatory subunit RII alpha. ####X%X00000000000X%

Example 15; Col 43-44; 35pp; English

The invention relates to antisense compounds targeted to nucleic acids encoding protein kinase A regulatory subunit RII alpha. The antisense compounds are useful for modulating the expression of protein kinase A (PKA) regulatory subunit RII alpha and for treating a disease or condition associated with expression of PKA regulatory subunit RII alpha. The compounds are also useful as research reagents and kits, or for diagnostics, therapeutics and prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents a human protein kinase A regulatory subunit RII alpha inhibitory oligomucleotide

New antisense oligonucleotides targeted to a nucleic acid molecule encoding complement component C3, useful for treating a disease or condition associated with complement component C3, e.g. autoimmune
                                                                                                                                                                  disorder or infection.
```

Claim 3; Page 25; 72pp; English

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding complement component C3. The compound specifically hybridises with the nucleic acid molecule encoding complement component C3, or specifically hybridises with at least an 8-nucleobase component C3. Also included are a composition of complement component C3. Also included are a composition comprising the component C3 in cells or tissues (comprising the expression of complement component C3 in cells or tissues (comprising complement C3 in cells or tissues) component C3 in cells or tissues of complement component C3 in cells or tissues of complement component C3 compound cited above) and treating an animal cappound administering to the animal the compound cited above so that expression of complement component C3 is inhibited. The antisense compounds are useful for inhibiting the expression of complement C3 in cells or tissues, or for treating an animal having a cutoimmune disorder (e.g. multiple solerosis), an infection, or atherosclerosis, inflammation, septic shock, multiple organ failure, component C3 in distinguishing functions of various members of a biological pathway, or for preventing or delaying confidence or infection, inflammation or tumour formation. The present sequence is an infection, inflammation or tumour formation. The present sequence is an inferior. antisense oligonucleotide targeting human C3

New homogeneous prodrug conjugate containing hepatic ligand for delivery of pathogen-specific oligomer useful for treating liver infections or

Disclosure, Page 23; 107pp; English

The invention relates to a novel homogeneous conjugate comprising a hepatic ligand, bifunctional linker and biologically stable oligomer that binds to a sequence in a hepatic virus or pathogen and is released from the conjugate by hydrolysis or reduction. The conjugate of the invention may be useful during the treatment of liver diseases including chronic viral hepatitis, cirrhosis, malaria, viral or protozoan infection and cancer, such as hepatocellular carcinoma (HCC). The current sequence is that of the DNA oligomucleotide 9 of the invention which is targeted to a Hepatitis C virus (HCV) sequence.

New polynucleotide designated 205PlBS, for diagnosing and treating prostate cancer, and as probes or primers for the amplification and/or detection of 205PlBS genes.

Example 1; Page 60; 162pp; English.

This invention relates to a novel gene designated 205P1B5, and the encoded protein, which is aberrantly expressed in prostate cancer. Specifically, it refers to the two variants of 205P1B5 mapped to chromosome 8p21-8p12, namely 205P1B5v1 and 205P1B5v2 and fragments thereof that serve as useful diagnostic, prophylactic, prognostic, prognostic and/ or therapeutic targets for prostate and other types of cancers. The present invention describes methods for the isolation of 205P1B5, for generating an immune response and for generating transgenic or knock out animals for

the development and screening of therapeutically useful reagents. Furthermore, it refers to identifying proteins, small molecules or other agents that interact with 205P185, and can be used to identify pathways activated by 205P185. Accordingly, these are cytostatic and immunogenic compositions that are useful for the development of cancer vaccines. This suppressive subtractive is the nested PCR primer 2 (NP2) used for suppressive subtractive hybridisation (SSH) to isolate the 205P185 cDNA fragment of the invention.

New albumin fusion protein comprising a human immunodeficiency virus (HIV) fusion inhibiting peptide and an albumin having an albumin activity, useful for treating a disease or disorder, e.g. HIV infection.

Example 3; Page 58; 105pp; English.

This invention relates to novel albumin fusion proteins comprising a human immunodeficiency virus (HIV) fusion inhibiting peptide, which exhibit anti-retroviral activity. Specifically, it refers to inhibitory peptides including T-20, T-1249, 5-Helix or cyanovirin-N that bind the HIV env protein, or derivatives thereof such as the HIV gp41 protein. Furthermore, the albumin activity has the ability to prolong the in vivo half-life of these HIV fusion inhibiting peptides. Accordingly, the present invention describes fusion proteins that neutralise HIV in a host of prince in mimune response and also antibodies that inhibit viral infection of uninfected cells. In this way, a method exists to prevent, treat or ameliorate HIV infection and/ or a disease caused by HIV infection and/ or a disease caused by HIV infection and/ or a disease caused by HIV infection and or a disease caused by HIV activity and can be used towards the production of a vaccine. This oligonucleotide sequence is the forward RI-PCR primer used to amplify the HIV-1 RNA in order to clone T-20, in an exemplification of the invention.

Example 7; SEQ ID NO 7; 28pp; English.

The invention describes a method of diagnosing endometriosis in a female suspected of having endometriosis comprising detecting the presence of a purified and isolated endometriotic haptoglobin (ENDO-1) and its functional analogues from a patient sample. The presence of the endometriotic haptoglobin is indicative of endometriosis. The invention provides purified and isolated glycoprotein and biologically functional analogues having specific physical and functional characteristics haptoglobin ENDO-1 cDNA.

121P1F1 gene nested primer (NP) 2 SEQ ID NO:721.
 29-JAN-2004 (first entry)
```

The present invention describes a composition (I) comprising a substance that modulates the status of 121PIF1 (gene and encoded protein), or a molecule that is modulated by 121PIF1, where the status of a cell that expresses 121PIF1 is modulated. The human 121PIF1 gene maps to chromosome 4q. (I) has cytostatic activity, and can be used in gene therapy, and in vaccines. The composition (I) can be used for diagnosing, preventing, prognosticating or treating patients with cancer that expresses 121PIF1, such as breast, colon, ovarian or lung cancer. The 12IPIF1 gene or its cragment can be used to elicit a humoral or cellular immune response. In 21PIF1 antibodies can be used in active or passive immunisation. 121PIF1 polymuclectides are useful as probes and primers for the amplification or detection of 121PIF1 polypeptides, or as tools for modulating or inhibiting the expression of 121PIF1 genes. The present sequence is used in the exemplification of 121PIF1 genes. 121P1F1; 121P1F1 modulation; human; chromosome 4q; cytostatic; gene therapy; vaccine; cancer; immune response; immunisation; primer; ss.                                                                                                                    14-FEB-2001.
```

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, BAR3/COUP-TF-1, the GATA transcription factor gene, IRP-2 and/or the CAATT Displacement Protein (CDF). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of Sequence 17 BP; 1 A; 9 C; 6 G; 1 T; 0 U; 0 Other; interferon alpha The present invention relates to oligonucleotides based on nucleotide sequences obtained from both wild-type tubercle bacilli (wrTB) that are susceptible to a drug and mutant-type tubercle bacilli (mrTB) that are resistant to a drug. The drugs used in the present invention are oligonucleotides, nucleic acid probes and primers are useful for ferentiating drug-resistance and determining infection with tubercle

Claim 21; Page 40; 114pp; English.

differentiating

sor genes, factor protein,

Enzymatic and antisense nucleic acid inhibition of repressor useful for producing e.g. granulocyte colony stimulating fact interferon alpha and erythropoietin.

Claim 37; Page 63; 164pp; English.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65$ sequence identity to (SI), acids (SI, ABB83999), a sequence having 65$ sequence of 730 amino acids (SI) having 95$ devitations. especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene, foncedent for protein as as an adaptor protein that interacts with Rho family small Grasses as well as downstream components of the signal transduction pathway. (I) is useful conciding (II) for identifying a specific binding partner. (I) and nucleic acids (II) coused by altered expression of human POSHL1 including diagnosing and caused by altered expression of human POSHL1 including diagnosing and transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to
                                                                                          Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                Example 2; SEQ ID NO 1752; 60pp + Sequence Listing; English.
WPI; 2002-684061/74.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB83999), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (1) and nucleic acids (II) encoding (1) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonuclectide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the European Patent Office

ö
present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL -1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBA399), a sequence having 6$$ sequence identity to (SI), (SI) having 95$ deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and mucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is
                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, POSHL 1; SH3 domain, POSH-like signalling protein 1, oncoger

useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence difformation supplied to Derwent by the Buropean Patent Office

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 312; 738pp; French.

The present invention relates to murine oligonucleotides (ACC62754-ACC68066), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia

Antisense compound, 8-30 nucleobases in length, inhibiting the expression Ets-2 is useful for treating cancer and detecting Ets-2 expression.

Claim 3; Col 40; 31pp; English.

Sequences AAAAB349-A38388 represent antisense oligonuclectides targetted to the human Ets-2 gene, which inhibit its expression. The antisense coligonuclectides were designed to target different regions of the human Ets-2 RNA, and were analysed for their effect on Ets-2 mRNA levels by Ets-2 RNA, and were analysed for their effect on Ets-2 mRNA levels by C guantitative real-time PCR. The Ets-domain transcription factors are a family of proteins which are involved in controlling key cellular events condity of proteins hared by all members of this family. Through this condity members bind to the promoter regions of various genes at a GCA consensus sequence, thereby acting as either represents or at a GCA consensus sequence, thereby acting as either represents or activators of the gene. All but one Ets family protein bind to DNA as a conomer. Ets-2 has been implicated in the regulation of cellular conomer. Ets-2 has been implicated in the regulation of cellular chromosome 21q22.3 which is within a region known to undergo translocations associated with malignancies. Ets-2 has been found to be upregulated in several cancers, including lymphoblastic leukaemia. It may also play a role in the cancer phenotype, as it activates the urokinase cupsaminogen activator (UPA) promoter and the promoters of calmidation. High levels of turb and metalloproteinases are associated with tumour invasion and metastasis in breast cancers. As the Ets-2 gene is located on chromosome 21, which is triplicated in Down's syndrome, it is also thought to be responsible for the skeletal abnormalities present con this condition. The antisense oligonuclectides of the invention are useful for the treatment or prophylaxis of conditions associated with Ets-2 expression, especially cancer

AAV46388-V46391 are PCR primers used in the isolation of a perchloroethane dehalogenase (PCE-DH) isolated from Dehalospirillum multivorans. This protein is used in a process for microbiological purification of water contaminated with chlorinated ethylenes and/or chlorinated propylenes. The process involves adding an electron donor a passing the water through a bloreactor containing a syntrophic mixed culture immobilised on a support, where the culture comprises at least one dehalogenating bacterium and at least one hydrogen-producing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Microbiological purification of water contaminated with chlorinated olefin(s) - using combination of dehalogenating and hydrogen-producing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ÷
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for detecting non-responders to anti-tumour necrosis factor (TNF) therapy. The method involves testing an individual for homozygosity for at least one single nucleotide polymorphism (SNP) in the gene coding for TNF receptor II, which is located on chromosome 1p36. Two novel SNPs, one in exon 2 (position 168 A/G) and one in exon 6 (position 587 T/G) which result in Lyssfelys and Met196Arg respectively, are also described. The method of the invention is useful for detecting non-responders to anti-TNF therapy such as infliximab therapy, or therapy of Crohn's disease. The genes containing the 2 novel polymorphisms are useful for diagnostic purposes in inflammatory, malignant or other chronic diseases. ABK3447-ABK33440 represent PCR primers used to amplify different regions of the human TNF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting non-responders to anti-human necrosis factor therapy, comprises testing an individual for homozygosity for a single nucleotide polymorphism in the gene coding for the tumor necrosis factor receptor

This sequence represents a preferred antisense oligomucleotide targetted against the gene encoding human microtubule-associated protein 4 (MAP4).

Inhibition of MAP4 expression was measured by determination of MAP4 mRNA levels in a variety of cell lines via real-time quantitative PCR. The cell lines used included the bladder carcinoma cell line PCR. The numan lung carcinoma cell line A549, human neonatal dermal fibroblasts and human embryonic keratinocytes. Microtubule-associated proteins comprise a group of proteins that mediate microtubule assembly and function which is required for cytoskeletal integrity. MAP4 is a member of the non-neuronal strabilising the microtubule lattice. MAP4 expression has been shown to be elevated in cells with mutant p53 oncogene expression, and is therefore linked to cancer chemcherapeutic drug sensitivity. These antisense molecules are useful for treating animals, particularly humans, having or being prone to a disease or condition associated with the expression of MAP4. The oligomucleotides are also useful for research and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense oligonucleotides for inhibiting microtubule-associated protein 4 expression, useful in treating disorders associated with microtubule protein expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          primers AAX21358-X21359 were used to PCR amplify a fragment of the 17DE1 locus sequence as a control sequence for analysis of BAI gene expression in blots. The BAI genes (see AAX2135-X2137) are expressed specifically in the brain and play an important role in cancer formation in the brain. The BAI proteins can be used in drug compositions to diagnose, prevent or
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human BAI gene - is expressed in brain plays important role in cancer formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Microtubule associated protein 4; MAP4; real-time quantitative PCR; expression; microtubule; assembly; function; cytoskeleton; structural; dynamic; stabilisation; lattice; overexpression; p53; oncogene; cancer; chemotherapy; tumour; drug sensitivity; antisense; therapy; hybridisation; inhibition; research; diagnostic; ss.

The specification describes a pre-trans-splicing molecule (PTW) which contains one or more target binding domains, a 3' splice region comprising a branch point, a pyrimidine tract and a 3' splice acceptor site, a spacer region separating the mRNA splice region from the target binding domain, and a nucleotide sequence to be trans-spliced. The method is used for the in vivo production of a trans-spliced molecule in a subset of cells. The PTM is used for producing chimeric mRNA molecule by contacting it with target pre mRNA which is useful for gene regulation, gene repair and targeted cell death particularly repair of cystic fibrosis trans-membrane regulator gene. The present primer was used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel pre-trans-splicing molecules for use in gene regulation, gene repair and targeted cell death particularly gene repair of cystic fibrosis trans-membrane regulator gene.

```

The specification describes a pre-trans-splicing molecule (PTM) which contains one or more target binding domains, a 3' splice region comprising a branch point, a pyrimidine tract and a 3' splice acceptor site, a spacer region separating the mRNA splice region from the target binding domain, and a nucleotide sequence to be trans-spliced. The method is used for the in vivo production of a trans-spliced molecule in a subset of cells. The PTM is used for producing chimeric mRNA molecule by contacting it with target pre mRNA which is useful for gene regulation, gene repair and targeted cell death particularly repair of cystic fibrosis trans-membrane regulator gene. The present primer was used to

New isolated polypeptides, NOV 1-3, having identity to thymosin-beta-10, ephrin type-A receptor 8 and proteoglycans, and polymucheotides, useful for treating male infertility, neurological or cardiac disease or rheumatoid arthritis.

Example 1; Page 83; 102pp; English.

The sequence represents a PCR primer used in expression analysis of ephrin type-A, receptor 8-like protein (NOV1). Thymosin-beta-10-like protein (NOV1), ephrin type-A receptor 8-like protein and proteoglycan[1] the proteins (NOV3) may be used in the diagnosis, treatment and proteoglycans. The protein of disorders caused by abnormal expression or activity of prevention of disorders caused by abnormal expression or activity of thymosin-beta-10, ephrin type-A receptor 8 and proteoglycans such as fibromedial and fibronectin. The polypeptides of the invention are useful in screening for agents that modulate their activity, and in determining predispositions to disorders. NOV1 is useful for treating conditions involving development, differentiation, and activation of thymic immune cells in pathologies related to spermatogenesis and male infertility, diagnosis of neoplasias, in diseases or pathologies of red blood cells or platelets, in detection of small cell lung cancer. NOV1 is useful for detecting cells expressing GPI-anchored chinched as a marker for prostate cancer, and in treating centuring and proteins are useful for treating orthopaedic disorders and/or injuries, and inflammatory diseases of connective tissues e.g. rheumatoid containing conservation or the prostate cancer, and intention contains are useful for treating orthopaedic disorders e.g. rheumatoid containing the conservation or the proposation of the contains are useful for treating orthopaedic disorders e.g. rheumatoid contains are useful for treating orthopaedic disorders e.g. rheumatoid contains are useful for treating orthopaedic disorders e.g. rheumatoid contains and inflammatory diseases of connective tissues e.g. rheumatoid contains are useful for treating orthopaedic disorders e.g. rheumatoid contains are useful for treating orthopaedic disorders e.g. rheumatoid contains are useful for treating orthopaedic disorders e.g. rheumatoid contains are useful for the contains are dysections of the contains are dysectined to the contains are dysecti

Novel membrane bound and secreted NOV polypeptides, for treating, diagnosing and preventing male infertility, neurological, cardiac and vascular pathologies, and inflammatory diseases e.g. rheumatoid arthritis.

Example 1; Page 118; 180pp; English.

The present invention relates to novel membrane bound and secreted NOV comported and polymucleotides encoding such proteins. Sequences of the invention are useful for treating or preventingly NOV-associated disorders of in humans and for manufacturing a medicament for treating a syndrome associated with human disease. They are useful for determining the presence of or predisposition to lung cancer. NOVI compounds are useful for development, differentiation and activation of thymic immune cells, pathologies related to spermatogenesis and male infertility, diagnosis of circulation such as red blood cells and platelets. NOVI nucleic acids are useful for detecting specific cell types and as specific marker for cancers in tissues. NOV2 and NOV4 compounds are useful for treating specific cell types and as specific marker for cancers in tissues. NOV2 and NOV4 compounds are useful to direct the cevelopment of nervous system and angiogenesis and for treating neurological, cardiac and vascular pathologies. NOV3 and NOV5 compounds concorned to treating various orthopsesis and NOV3 compounds concorned are useful for treating various orthopsesis of the marker for congenital muscular distormer, tissue e.g. rheumatoid arthritis, congenital muscular distormer, warious muscular discorders incorporate (for treating acopy, dysprothrombinaemia, hypoprothrombinaemia, type I and corporate (for treating acopy, dysprothrombinaemia, hypoprothrombinaemia, noveledent of lung, certical carcinoma, hyperparathyroidism, carcinoid syndrome, unltiple endocrine neoplasmial (multiple mysloms, parathyroid adenomatosis I, prolactinoma, hyperparathyroidism, carcinoid syndrome, and ultiple endocrine neoplasmial (multiple mysloms, parathyroid adenomatosis I, prolactinoma, hyperparathyroidism, carcinoid syndrome, and as vaccines (for the invention are also used in gene therapy and as vaccines I the exemplification of the invention

Example; Page 43; 229pp; English.

The present invention describes a cell (I) comprising pre-trans-splicing molecules (PTMs) (II) which have one or more target binding demains (IIa) controlled that target binding of PTM to pre-mRNA, 3 splice region (IIb) that includes branch point pyrimidine tract and 3'splice acceptor site, or 5' conprises (IIC), spacer region (IId) that separates RNA splice site (IIC), spacer region (IId) that separates RNA splice site (III) and (IIE); or (B) (IIC) (IId) and (IIE) be trans-comprised to target-pre-mRNA. Optionally, the cell comprises (II) either comprising: (A) (IIb) and (IIE); or (B) (IIC) (IId) and (IIE) The cell mmunosuppressive and antimicrobial activities, and can be used in gene therapy. (II) comprising one or more (preferably two or more) (IIB) and (III), (III) and (IIE), or (II) (III) and (IIE), or (III) (III) and (III), (III) comprises sequence encoding a toxin or translatable comprises sequence comprising components. The chimeric produced comprises sequences comprising exons 1-10 of cystic (II) that comprises nucleotide sequence regulator (CFIR). The chimeric RMA produced using (II) which either comprises (A) or (B) further comprises a nucleotide sequence regulator (CFIR). The chimeric RMA various diseases including genetic, infectious or autoimmune diseases and produced using dependence and to regulator comprises trans-membrane sonderer and to regulate gene expression in complication of the present invention

Arraying genome clones.

Claim 4; Page 22; 528pp; Japanese.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell containination Nos. that the same discrimination Nos succeed to containination Nos. the miltiwell plates of the specified discrimination Nos. to array the multiwell containination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the call and lateral directions; (f) the mixed clones are cultured and the reconstituted as the positions on the chromosome and arrayed. The clones are processed to plates are specified from the edsected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The mixed plates for human chromosome 1936-35 DNA, and ABL43323 to ABL43534 to represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention

Quantitating messenger RNA in sample - using immobilised-polynucleotide having sequence complementary to sequence unique to the MRNA.

Example 9, Page 71; 177pp; English.

The sequences given in AAQ47594-603 show regions of homology between jun sequences and the jun-B specific probe B-1258 which may be of use as jun-B specific probes. They were used in the method of the invention for the gracific probes. They were used in the method of the invention for the guzify the many from cells. The claimed method comprises identifying a purify the mRNA from cells. The claimed method comprises identifying a polymucleotide sequence unique to the mRNA, and immobilising an oligomer componente are washed from the support such that the unique sequence then incubated with the insoluble support such that the unique sequence components are washed from the support and bound RNA is labelled in such components are washed from the support. The amount of bound label is then a way that the label is incorporated onto the support relative to the amount of mRNA on the support. The amount of bound label is fine cell of the amount of many be used for the reliable, rapid, simultaneous cell agnosing and recognition of pathophysiclogy of various disease states, cancer, and infectious disease states, cancer, and infectious disease states, cancer, and infectious disease states. Cell deficiency of Gs protein is the molecular basis of hereditary contain mutant ds proteins. G proteins are also involved in invasive contain mutant ds proteins. G proteins are also involved in invasive contain mutant ds proteins are also involved in invasive contain metastatic melanoma cells, and diabetes. See also AAQ473B1-666.

```
AAT50887-T50904 represent oligomucleotides of the invention. These sequences are all probes for interleukin-6 receptor (IL-6R) mRNA. IL-6 is one of the most well characterised of the cytokines. It functions through interacting with at least two transmembrane glycoprotein receptor molecules on the surface of target cells. The receptors are the IL-6R, and the signal transductor py IL-6 involves the concerted action of both IL-6R and gpl30. IL-6 overproduction is implicated in many different disease states, particularly in cellular proliferation associated with these diseases. These sequences bind to the IL-6R coding sequence, thereby inhibiting IL-6R production. The sequences therefore inhibit the functioning of IL-6R production. The coligomucleotides are especially useful for treating cancer (e.g. renal cell carcinoma), autoimmune diseases or viral infections. They can also be used as probes for detecting IL-6 receptor mRNA, especially for evaluating the effectiveness of drugs in reducing IL-6 receptor mRNA
                                                                                                                                               Probe; interleukin-6 receptor; IL-6R; cytokine; cellular proliferation; transmembrane glycoprotein receptor; signal transducer; gp130; inhibitor; IL-6; cancer; renal cell carcinoma; autoimmune disease; viral infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligo:nucleotide(s) complementary to interleukin-6 receptor mRNA - for treating proliferative diseases, e.g. cancer, auto-immune diseases or viral infections.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyxosine kinase 1 (ELL1), kinase insert domain containing receptor (XDR) and/or foetal liver kinase 1 (Elk-1) (e.g. tumour anglogenesis, coular diseases, postriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAXX7275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention

Seguence 17 BP; 1 A; 6 C; 8 G; 0 T; 2 U; 0 Other;

Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

                                                                                                                                                                                                                                                           The sequences given in AAT85503-06 are oligos which were used in the isolation of coding sequences from human chromosome 16. The invention contains details of the sequences encoding human netrin (hNET), human ATP828 Binding Cassette transporter (hABG2), human ribosomal L3 (SEM L3), and human augmenter of liver regeneration (hARR). The hNET gene can be used to develop chemostractants for use in axon regeneration. The hABG3 gene may be used in therapeutic applications for cystic fibrosis. The hABC3 gene may be used to develop products for treating damaged liver and liver diseases. The products can also be used for detection, diagnosis and screening assays. These oligonucleotides of may be used as primers in exon trap amplification experiments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; netrin; ATPase binding cassette transporter; ribosomal L3; augmenter of liver regeneration; hNET; hABC3; SEM L3; hALR; chromosome 16; exon trapping; axon; chicken; laminin domain; C. elegans; UNC-6; cystic fibrosis; ss.
                                                                                                                                                                                                 New isolated human chromosome 16 genes - encode netrin, ATPase binding cassette transporter, ribosomal L3 sub-type or augmenter of liver

The sequences given in AAPBS475-83 hybridise under stringent conditions to the sequence encoding the ATPase binding cassette transporter protein (habs3). The hABG3 genomic sequence was isolated from human chromosome 16 by exon trapping, hABG3 cDNA contains an open reading frame of 1685 amino acids. Comparison of ABC1, ABC2 and hABG3 reveals significant conservation in the regions surrounding the two ATP binding cassettes. The ATP binding cassettes of hABG3 flank a large linker domain containing numerous polar residues. The presence of these features in the linker domain suggests that this domain may play a regulatory role similar to the R domain of CPTR. The hABC3 gene may be used in therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; netrin; ATPase binding cassette transporter; ribosomal L3; augmenter of liver regeneration; hNET; hABC3; SEM L3; hALR; chromosome 16; exon trapping; axon; chicken; laminin domain; C. elegans; UNC-6; cystic fibrosis; ss.

ö

The sequences given in AAT85475-83 hybridise under stringent conditions to the sequence encoding the ATF8se binding casette transporter protein (hABC3). The hABC3 genomic sequence was isolated from human chromosome 16 by exon trapping. hABC3 cDNA contains an open reading frame of 1685 amino acids. Comparison of ABC1, ABC2 and hABC3 reveals significant conservation in the regions surrounding the two ATF binding casettes. The ATF binding casettes of hABC3 flank a large linker domain containing numerous polar residues. The presence of these features in the linker the ATF domain may play a regulatory role similar to the R domain of CFTR. The hABC3 gene may be used in therapeutic *6666666666668*

Jarvis T, Mcswiggen JA, Stinchcomb DT;

Enzymatic nucleic acid molecules which specifically cleave RNA derived from a c-fos gene - useful for treating conditions related to levels of c-fos, especially cancer.

Claim 2, Page 50, 72pp, English.

The present invention describes an enzymatic nucleic acid molecule which specifically cleaves RNA derived from a c-fos gene. AAV95401 to AAV95540 and AAV95541 to AAV95541 represent hammerhead ribozymes and hairpin ribozymes, respectively, which specifically cleave human c-fos. AAV95261 to AAV95400 and AAV95585 to AAV95628 represent human c-fos target cancer associated with elevated levels of c-fos oncogene, especially leukaemias, neuroblastomas and lung, breast and colon cancers. The ribozymes may also be used a diagnostic tools to examine genetic drift and mutations within diseased cells, or to detect the presence of c-fos RNA in a cell

Oligonucleotides AAV16310-25 are used to clone addional sequences of nucleic acids encoding human netrin (hNET), human ATP binding cassette transporter (LABC2), human ribosomal 13 (RPL31), and human augmenter of liver regeneration (hALR). Partial DNA sequences from these genes were isolated using exon traps AAW46753-57. Genetrapper, 3' RACE and RT-PCR were employed to identify additional sequences. The antisense oligonucleotides of the isolated sequences are used to modulate expression of hNET, hABC3, RPL31 or hALR, and prevent its translation. Antibodies against hNET, hABC3, RPL31 and hALR can be used to block binding of their naturally occurring ligands. The host cells containing vectors with DNA inserts encoding the proteins can be used to a method for identifying compounds which bind to hNET, hABC3, RPL31 or hALR.

Modulation or alteration of hABC3 substrate specificity may have significant therapeutic implications for cystic fibrosis. hALR could be used in the treatment of damaged liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human chromosome 16 genes encoding netrin, ATP binding cassette transporter, ribosomal L3 and augmenter of liver regeneration proteins useful for, e.g. treatment of liver disease and cystic fibrosis.
                                                                                                                                                                         Human; netrin; hNET; ATP binding cassette transporter; hABC3; ribosomal L3; RPL3L; augmenter of liver regeneration; hALR; treatment; trapping; modulation; expression; antibody; identification; binding; substrate specificity; ligand; exon trap; PCR primer; amplify; ss.
                                                                                                                                      Primer used to clone additional sequences of ABC, NET, ALR and RPL3L.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Connors TD, Dackowski WR, Van Raay TJ;

Human chromosome 16 genes encoding netrin, ATP binding cassette transporter, ribosomal L3 and augmenter of liver regeneration proteins useful for, e.g. treatment of liver disease and cystic fibrosis.

Claim 40; Page 25; 220pp; English.

oligonucleotides AAV16326-32 are used to clone addional sequences from nucleic acids encoding human ATP binding cassette transporter (hABC3).

Partial DNA sequences from the genes was isolated using exon traps additional bequences. The ABC gene is located in the PKD1 locus, between additional sequences. The ABC gene is located in the PKD1 locus, between the ECM1 and D162291 markers in a centromeric to telomeric orientation.

The sequence shows homology with murine ABC1 and ABC2 genes. The ABC proteins are responsible for the transport of a wide variety of substrates across cell membranes. Proteins in this family are linked by strong structural similarities. ABC transporters govern unidirectional cransport of molecules into or out of cells and across subcellular membranes. The antisense oligonucleotides of the ABC3 gene sequence are membranes. The antisense oligonucleotides of the ABC3 gene sequence are commented to be used to block binding of its naturally occurring against ABC can be used to block binding of its naturally occurring cortein can be used in a method for identifying compounds which bind to be significant therapeutic implications for cystic fibrosis

A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RGG) from the genomic sample and analysing the RGG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs.

Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin. WPI; 2000-647423/62. 

Claim 37; Page 78; 164pp; English.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor. EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the GAAT Displacement Protein (CPP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                             ö
                                                        of
encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropotetin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to
                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                        ö

RIBOZYME PHARM INC. BLATT L.

(RIBO-) RIBOZYME PHARM (BLAT) BLATT L. (MCSW/) MCSWIGGEN J. (CHOW/) CHOWRIRA B M.

Chowrira BM Blatt L, Mcswiggen J,

WPI; 2001-607195/69.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 79; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NG20). The regulates expression of a neurite growth inhibitor gene (NG20). The CD20 mucleic acids acids eaving a an RNA molecule possessing an Indoxyme or a DNAzyme or an amberzyme (cleaving RNA with a NRN moleif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NRN moleif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NCH motif) proposessing an NCH motif) a G-cleaver (cleaving RNA with a NCH motif) proposessing an NCH motif) a gradual propose (cleaving RNA with a YG2 motif). The CD20-targetting nucleic acid is used to cleave RNA of CC of CD20 in the presence of a divalent cation that is preferably MG²+.

Furthermore, it may be contacted with a coll to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CC CD20. The treatment may further comprise the use of fone or more characterist in particular, be-call lymphoma, low-grade or follicular NHL, lymphocytic lymphoma, leukaemia, and inflammatory arthropathy. The NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably MG²+. Furthermore, the conclain and treat a patient having a condition associated MHL, mance of the contacted with a cell to reduce NOGO activity of the CC CC therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce acid may be used to the captows system (NNS) injury model cation associated with the level of the contacted neuropathy, amyotrophic lateral acid caid may be contacted with a cell to reduce acid may be contacted with a cell to reduce NOGO activity of the NOGO-the treatment may further compise the use of one or more cell and treat a patient having a condition associated may be used to treat central nervous system (NNS) injury model cation accided acided or a sequence is an inozyme of the invention

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gane or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 131; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids (e.g. a ribozyme or a DNAZYME) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a DNAZYME) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH mocif), a G-cleaver (cleaving RNA with a NYM mocif) pr an amberzyme (cleaving RNA with a NGM triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-atty and nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2^+. Purthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more

RIBOZYME PHARM INC. RIBO-> (BLAT/)

BLATT L. MCSWIGGEN J. CHOWRIRA B M. CHOM/)

Chowrira BM; Mcswiggen J, Blatt L,

WPI; 2001-607195/69. 

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 85; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGOD). The regulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic and in nozyme (an endolytic nucleic acid cleaving an RNM molfl) proposessing an NCH molfl). The CD20-targetting RNM with a NCH will propose (cleaving RNM with a NCH will) a respective (cleaving RNM with a NCH molfl). The CD20-targetting nucleic acid is used to cleave RNA of the presence of a divalent cation that is preferably Mg² +. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular nontreavament, immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, compania, and inflammatory arthropathy. The NOGO gene in the presence of a divalent cation that is preferably Mg² +. Furthermore, the creatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of the cell and treat a patient having a condition associated with the level of the stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemchbrapy-induced neuropathy, and/Or other neurodegenerative disease taxia, Huntington's disease, central response of the invention of NOGO expression. The present secure is an inozyme of the invention of NOGO expression. The present sequence is an inozyme of the invention

Chowrira BM;

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NG20). The regulates expression of a neurite growth inhibitor gene (NG20). The consists of an individual part of a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic acids an INCH moutle; present on the nucleic acid cleaving RNA with an NRN motif) prossessing an NCH motif), a G-cleaver (cleaving RNA with an NRN motif) prossessing an NCH motif), a G-cleaver (cleaving RNA with a NRN motif) prossessing an NCH motif), a G-cleaver (cleaving RNA with a Presence of a divalent cation that is preferably MG²+. Creat User of CD20 in the presence of a divalent cation that is preferably MG²+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of fone or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma (NCL), immunocytoma (NCL), small B-cell lymphocytic lymphoma, CCC (mucleic acid may be contacted with a cell to reduce NCGO activity of the creatment may further comprise the use of one or more presence of a divalent cation that is preferably MG²+. Furthermore, the creatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of the contacted with a cell to reduce NCGO activity of the contacted with a cell to reduce NCGO activity of the contacted with a cell to reduce NCGO activity of the contacted with a cell to reduce NCGO activity of the contacted with a cell to reduce NCGO activity of the contacted with a cell to reduce NCGO activity of the contacted with a cell to reduce NCGO activity of the contacted with a cell to reduce NCGO activity of the contacted with a cell to reduce NCGO activity of the contacted with a cell to reduce NCGO activity of the contacted neuropsethy, a Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and sequence is an inozyme of the invention Claim 88; Page 79; 200pp; English. central nervous system injury.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids aribozyme or a concleic acids may be enzymatic nucleic acid cleaving an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule con amberzyme (cleaving RNA acid cleaving RNA to make an amberzyme (cleaving RNA to contact an amberzyme (cleaving RNA to contact an amberzyme (cleaving RNA to contact and the acid is used to cleave RNA with a VYZ motif). The CD20-targetting nucleic acid is used to cleave RNA coff contact a patient having a condition associated with the level coff cD20. The treatment may further comprise the use of one or more contract lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-crow treat lymphoma (NHL), bulky low-grade or follicular non-cleukaemia, HIV (human immunodeficiency virus) associated NHL, lymphoma, contact lymphoma (NML), immunocytoma (MC), small B-cell lymphoma, contact lymphoma, contact acid massociated NHL, mantle-cell contact the contact lymphoma in the interpathy. The NOGO gene in the targetting nucleic acid is used to cleave RNA of the NOGO gene in the

The present invention describes a human genome-derived myosin-like protein 1 (hgbMLP-1). The protein and polymucleotide sequences of hgbMLP-1 can be used in gene therapy and vaccine production. The hgbMLP-1 mucleic acids in samples, as amplification substrates, to nucleic acids in samples, as amplification substrates, to hgbMLP-1 mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hgbMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hgbMLP-1 proteins or polypeptides may be concentration and/or amount specifically of hgbMLP proteins or specific blomolecule and/or amount specifically of hgbMLP proteins, as specific blomolecule capture probes for surface-enhanced laser desoxiption indisation, as therapeutic supplement in patients having specific deficiency in hgbMLP-1 production, and in vaccines or for xeplacement therapy. The production, and in vaccines or for xeplacement therapy. The production, and in vaccines or for xeplacement therapy. The production, and in vaccines or for xeplacement therapy. The production, and in vaccines or for xeplacement therapy. The production, and in vaccines or for xeplacement therapy. The production, and in vaccines and holds.

CC polymuclectide sequence expressents an oligomer used in the screening of the holds. He sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO ct figure in the very production of the present invention. ô Gaps ö Query Match

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 claim be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates to the protein earlies acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypoptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specifically recognise hGDMLP-1 proteins, as specific biomolecule concentration and/or amount specifically of hGDMLP proteins, as specific deficiency in hGDMLP-1 proteins, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The protein and sealences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1 is particular heart and skaletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip., when the present and patent did not form part of the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chen W, Shannon ME;

Shannon ME; Gu Y, Ji Y, Penn SG, Hanzel DK, Rank DR, Chen W, WPI; 2002-179446/23. New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

Disclosure, SEQ ID NO 1010; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the represent in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and with the expression of hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fits wipo.int/pub/published_pot_esquence

(AEOM-) AEOMICA INC.

DK, Rank DR, Chen W, Shannon ME; Hanzel Gu Y, Ji Y, Penn SG, WPI; 2002-179446/23. New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

Disclosure; SEQ ID NO 7563; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1): The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification substrates to hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be cased as immunospens for raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser described biomolecule therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines of for replacement therapy. The polymolectide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart can disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDWLP-1 sequence in the exemplification of the present invantion. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence 8888888

```
The present invention relates to human testis expressed Patched like protein (HTPL, see ABV7875 to ABV78762 and ABB9819 to ABB9820). HTPL protein (HTPL, see ABV7875 to ABV78762 and ABB9819 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-8 (8 for short) compared to HTPL-16 (1 for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The care of that of Patched, and is a potential tumour suppressor. HTPL is not to that of Patched, and is a potential tumour suppressor. HTPL is contact in regulating male germ cell development, and the HTPL gene was important in regulating male germ cell development, and the HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of the HTPL. Such disorder sancdude disorders of testis, or adrenal, adult and fortal muscle or colon function. HTPL proteins and mucleic acids are clinically useful diagnostic markers and potential therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 17 BP; 1 A; 8 C; 6 G; 2 T; 0 U; 0 Other;
